## Waves on Lines

- If the wavelength to be considered is significantly greater compared to the size of the circuit the voltage will be independent of the location.

but this is not true at short wavelengths = high frequencies...

© Göran Jönsson, EIT 2015-04-27

Vector Network Analysis

$$v = \frac{\lambda}{T} = \lambda \cdot f$$

$$\Rightarrow \lambda[m] = \frac{v}{f} = \frac{300}{f[\text{MHz}]}$$

The voltage or the current  
is a function of both  
time and distance

## Travelling Voltage Wave on a Lossless Line

$$v^+(t, z) = |V_0^+| \cos(\omega t - \beta z + \phi_0^+) = \operatorname{Re}[V_0^+ e^{j(\omega t - \beta z)}]$$

- where  $V_0^+ = |V_0^+| e^{j\phi_0^+}$  = the complex amplitude of  $v^+(t, z)$  at  $z = 0$

4

## Reflection Coefficient

- Definition:

$$\Gamma = \frac{\text{reflected voltage wave}}{\text{incident voltage wave}} = \frac{V^- e^{\gamma z}}{V^+ e^{-\gamma z}}$$

© Göran Jönsson, EIT 2015-04-27

Vector Network Analysis

5

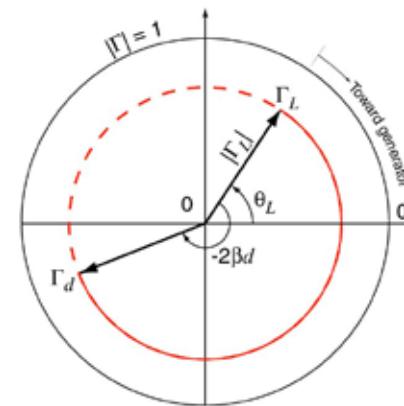

## Reflection Coefficient

- Polar diagram

$$\Gamma_d = \Gamma_L e^{-2\gamma d} = \Gamma_L e^{-2\alpha d} e^{-2j\beta d}$$

Implies a rotation in the polar  $\Gamma$ -plane

Lossless transmission line

Vector Network Analysis

7

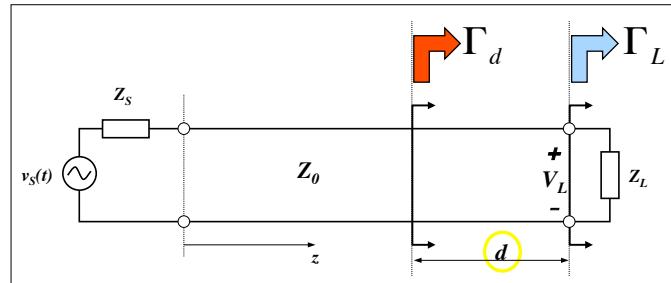

Lossy transmission line

## Reflection Coefficient

- At an arbitrary location  $d$  at the line the reflection coefficient is

$$\Gamma_d = \Gamma_L e^{-2\gamma d} = \Gamma_L e^{-2\alpha d} e^{-2j\beta d}$$

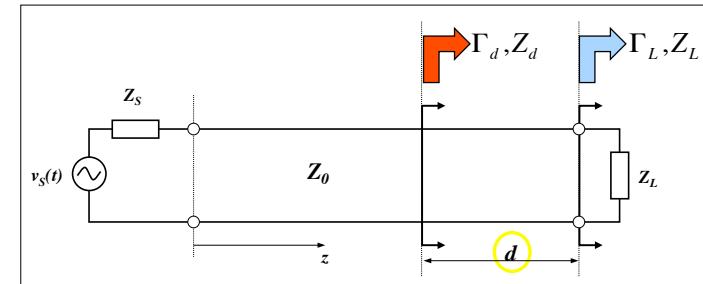

© Göran Jönsson, EIT 2015-04-27

Vector Network Analysis

6

## Conversion of Reflection Coefficient to Impedance

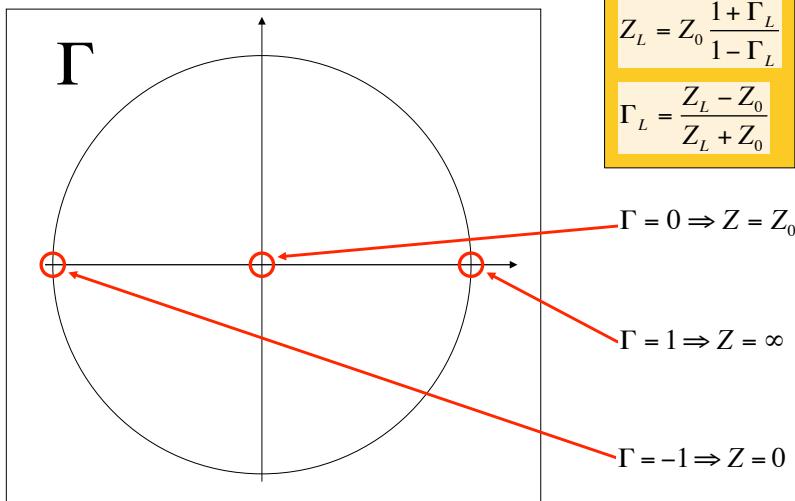

$$\Gamma_d = \frac{Z_d - Z_0}{Z_d + Z_0} \Rightarrow Z_d = Z_0 \frac{1 + \Gamma_d}{1 - \Gamma_d}$$

## Definition of S-parameters

- Model:

$a_x$  = incident wave  
 $b_x$  = reflected wave

$$\begin{cases} b_1 = s_{11} \cdot a_1 + s_{12} \cdot a_2 \\ b_2 = s_{21} \cdot a_1 + s_{22} \cdot a_2 \end{cases} \quad \begin{bmatrix} b_1 \\ b_2 \end{bmatrix} = \begin{bmatrix} s_{11} & s_{12} \\ s_{21} & s_{22} \end{bmatrix} \begin{bmatrix} a_1 \\ a_2 \end{bmatrix}$$

$$S_{11} = \left. \frac{b_1}{a_1} \right|_{a_2=0} \quad S_{12} = \left. \frac{b_1}{a_2} \right|_{a_1=0}$$

$$S_{21} = \left. \frac{b_2}{a_1} \right|_{a_2=0} \quad S_{22} = \left. \frac{b_2}{a_2} \right|_{a_1=0}$$

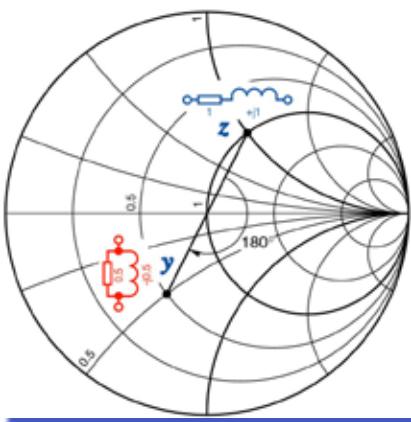

**IMPORTANT!**  
The definition utilizes  
50Ω as  
reference impedance

© Göran Jönsson, EIT 2015-04-27

Vector Network Analysis

15

## Example of Smith Chart Usage

Conversion  
impedance  $\Rightarrow$  admittance

$$z = \frac{1}{y}$$

$$\Gamma(y) = \frac{1/y - 1}{1/y + 1} = -\frac{y - 1}{y + 1} = -\Gamma(z) = e^{j\pi}\Gamma(z)$$

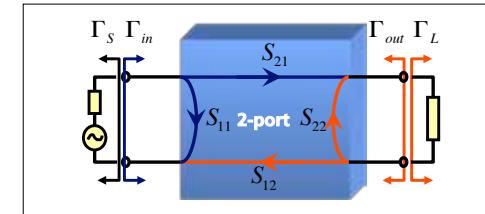

### Series connection

- Addition of resistance:  
• motion at constant reactance circle
- Addition of reactance:  
• motion at constant resistance circle

Vector Network Analysis

14

## Measurement of S-parameters

$$\Gamma_{in} = S_{11} + S_{12}S_{21} \frac{\Gamma_L}{1 - S_{22}\Gamma_L} = S_{11} \Big|_{\Gamma_L=0}$$

$$\Gamma_{out} = S_{22} + S_{12}S_{21} \frac{\Gamma_S}{1 - S_{11}\Gamma_S} = S_{22} \Big|_{\Gamma_S=0}$$

The S-parameters are easily measured if the ports are terminated by the reference impedance  $Z_0 = 50\Omega$  ( $\Gamma_L$  respectively  $\Gamma_S = 0$ )

$$S_{11} = \left. \frac{b_1}{a_1} \right|_{a_2=0} \quad S_{12} = \left. \frac{b_1}{a_2} \right|_{a_1=0}$$

$$S_{21} = \left. \frac{b_2}{a_1} \right|_{a_2=0} \quad S_{22} = \left. \frac{b_2}{a_2} \right|_{a_1=0}$$

Vector Network Analysis

20

## Calibration

- Attenuation and phase shift in the test cables must be compensated
- Calibrated reference planes are therefore created where the device under test is connected

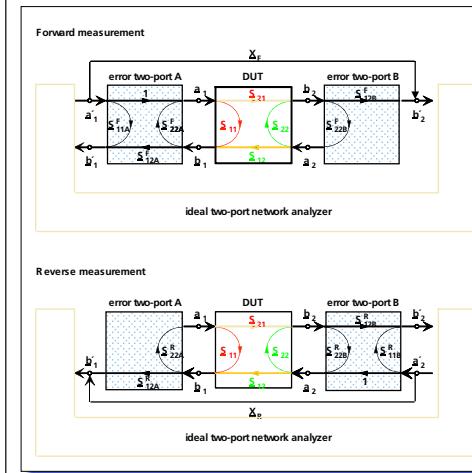

© Göran Jönsson, EIT 2015-04-27

Vector Network Analysis

21

## Calibration

### TOSM - Classical Full Two-Port Calibration

Extension of the one port error model by 3 additional error terms for forward direction yields 6 error terms. Adding a similar model for reverse direction yields the classical  
⇒ 12-term error model (TOSM)

- Load matches
- Transmission losses of receiver
- Device independent crosstalks

## Be careful about torn connectors!

- The wear and tear when connectors are connected and disconnected may result in measurement errors.
  - always check that the connectors are clean
  - only turn the socket or the nut
    - the contact pin may never spin round
  - always use a torque wrench
    - the connector may never be fastened by other tools if you tighten up to hard the thread is harmed
- Test cables and connectors for professional use are only used for a limited period until they will be exchanged or reconditioned.
