MOTOROLA

SN54/74LS95B

4-BIT SHIFT REGISTER

The SN54/74LS95B is a 4-Bit Shift Register with serial and parallel synchronous operating modes. The serial shift right and parallel load are activated by separate clock inputs which are selected by a mode control input. The data is transferred from the serial or parallel D inputs to the Q outputs synchronous with the HIGH to LOW transition of the appropriate clock input.

The LS95B is fabricated with the Schottky barrier diode process for high speed and is completely compatible with all Motorola TTL families.

FUNCTIONAL DESCRIPTION

The LS95B is a 4-Bit Shift Register with serial and parallel synchronous operating modes. It has a Serial (D_S) and four Parallel (P_0-P_3) Data inputs and four Parallel Data outputs (Q_0-Q_3). The serial or parallel mode of operation is controlled by a Mode Control input (S) and two Clock Inputs (CP_1) and (CP_2). The serial (right-shift) or parallel data transfers occur synchronous with the HIGH to LOW transition of the selected clock input.

When the Mode Control input (S) is HIGH, $\overline{CP_2}$ is enabled. A HIGH to LOW transition on enabled CP_2 transfers parallel data from the P_0-P_3 inputs to the Q_0-Q_3 outputs.

When the Mode Control input (S) is LOW, CP_1 is enabled. A HIGH to LOW transition on enabled $\overline{CP_1}$ transfers the data from Serial input (D_S) to Q_0 and shifts the data in Q_0 to Q_1, Q_1 to Q_2, and Q_2 to Q_3 respectively (right-shift). A left-shift is accomplished by externally connecting Q_3 to P_2, Q_2 to P_1, and Q_1 to P_0, and operating the LS95B in the parallel mode (S = HIGH).

For normal operation, S should only change states when both Clock inputs are LOW. However, changing S from LOW to HIGH while CP_2 is HIGH, or changing S from HIGH to LOW while CP_1 is HIGH and CP_2 is LOW will not cause any changes on the register outputs.

DESCRIPTION OF TERMS

SETUP TIME(ts) —is defined as the minimum time required for the correct logic level to be present at the logic input prior to the clock transition from HIGH to LOW in order to be recognized and transferred to the outputs.

HOLD TIME (th) — is defined as the minimum time following the clock transition from HIGH to LOW that the logic level must be maintained at the input in order to ensure continued recognition. A negative HOLD TIME indicates that the correct logic level may be released prior to the clock transition from HIGH to LOW and still be recognized.

AC WAVEFORMS

The shaded areas indicate when the input is permitted to change for predictable output performance.
