VANTIS

BEYOND PERFORMANCE

Includes MACH 4A Family Advance Information

MACH 4 CPLD Family

High Performance EE CMOS Programmable Logic

FEATURES

- **High-performance, EE CMOS 3.3-V & 5-V CPLD families**
- **Flexible architecture for rapid logic designs**
  - — Excellent First-Time-Fit™ and refit
  - — SpeedLocking™ for guaranteed fixed timing
  - — Central, input and output switch matrices for 100% routability and 100% pin-out retention
- **High speed**
  - — 5.0ns t_{PD} Commercial and 7.5ns t_{PD} Industrial
  - — 182MHz f_{CNT}
- **32 to 512 macrocells; 32 to 768 registers**
- **44 to 352 pins in PLCC, PQFP, TQFP and BGA packages**
- **Advanced capabilities for easy system integration**
  - — 3.3-V & 5-V JEDEC-compliant operations
  - — JTAG (IEEE 1149.1) compliant for boundary scan testing
  - — 3.3-V & 5-V JTAG in-system programming
  - — PCI compliant (-50/-55/-60/-65/-7/-10/-12 speed grades)
  - — Safe for mixed supply voltage system designs
  - — Programmable pull-up or Bus-Friendly™ inputs and I/Os
  - — Hot-socketing
  - — Programmable security bit
  - — Individual output slew rate control
- **Flexible architecture for a wide range of design styles**
  - — D/T registers and latches
  - — Synchronous or asynchronous mode
  - — Dedicated input registers
  - — Programmable polarity
  - — Reset/ preset swapping
- **Advanced EE CMOS process provides high-performance, cost-effective solutions**
- **Supported by Vantis DesignDirect™ software for rapid logic development**
  - — Supports HDL design methodologies with results optimized for Vantis
  - — Flexibility to adapt to user requirements
  - — Software partnerships that ensure customer success
- **Vantis and third-party hardware programming support**
  - — VantisPRO™ (formerly known as MACHPRO®) software for in-system programmability support on PCs and automated test equipment
  - — Programming support on all major programmers including Data I/O, BP Microsystems, Advin, and System General

GENERAL DESCRIPTION

The MACH® 4 family from Vantis offers an exceptionally flexible architecture and delivers a superior Complex Programmable Logic Device (CPLD) solution of easy-to-use silicon products and software tools. The overall benefits for users are a guaranteed and predictable CPLD solution, faster time-to-market, greater flexibility and lower cost. The MACH 4 devices offer densities ranging from 32 to 512 macrocells with 100% utilization and 100% pin-out retention. Both the MACH 4 and the MACH 4A families offer 5-V (M4-xxx and M4A5-xxx) and 3.3-V (M4LV-xxx and M4A3-xxx) operation.

MACH 4 products are 5-V or 3.3-V in-system programmable through the JTAG (IEEE Std. 1149.1) interface. JTAG boundary scan testing capability also allows product testability on automated test equipment for device connectivity.

All MACH 4 family members deliver First-Time Fit and easy system integration with pin-out retention after any design change and refit. With multi-tiered central switch matrices, enhanced logic arrays, intelligent logic allocators with an XOR gate and multi-clocking, the MACH 4 family has D or T-type registers and latches as well as synchronous/asynchronous logic and flexible set/reset capabilities. For both 3.3-V and 5-V operations, MACH 4 products can deliver guaranteed fixed timing as fast as 5.0 ns t_{PD} and 182 MHz f_{CNT} through the SpeedLocking feature when using up to 20 product terms per output (Tables 3 and 4).

The MACH 4 family offers 13 density-I/O combinations in Thin Quad Flat Pack (TQFP), Plastic Quad Flat Pack (PQFP), Plastic Leaded Chip Carrier (PLCC), and Ball Grid Array (BGA) packages ranging from 44 to 256 pins (Tables 5 and 6). It also offers I/O safety features for mixed-voltage designs so that the 3.3-V devices can accept 5-V inputs, and 5-V devices do not overdrive 3.3-V inputs. Additional features include Bus-Friendly inputs and I/Os, a programmable power-down mode for extra power savings and individual output slew rate control for the highest speed transition or for the lowest noise transition.

Note:

1. *All information on MACH 4A devices is Advance Information. Please contact a Vantis sales representative for details on availability.*

Vantis offers software design support for MACH devices in both the MACHXL® and DesignDirect development systems. The DesignDirect development system is the Vantis implementation software that includes support for all Vantis CPLD, FPGA and SPLD devices. This system is supported under Windows ’95, ’98 and NT as well as Sun Solaris and HPUX.

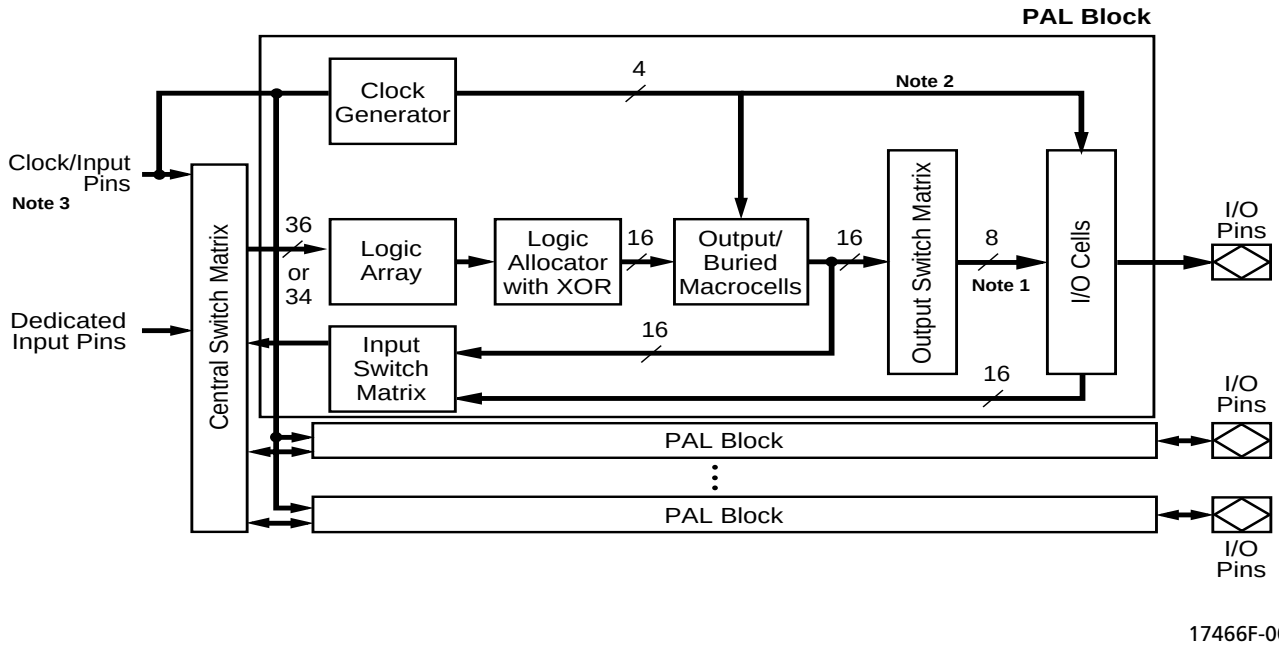
DesignDirect software is designed for use with design entry, simulaion and verification software from leading-edge tool vendors such as Cadence, Exemplar Logic, Mentor Graphics, Model Technology , Synopsys, Synplicity, Viewlogic and others. It accepts EDIF 2 0 0 input netlists, generates JEDEC files for Vantis PLDs and creates industry-standard EDIF, Verilog, VITAL-compliant VHDL and SDF simulation netlist for design verification.

DesignDirect software is also available in product configurations that include VHDL and Verilog synthesis from Exemplar Logic and VHDL, Verilog RTL and gate level timing simulation from Model Technology. Schematic capture and ABEL entry, as well as functional simulation, are also provided.

FUNCTIONAL DESCRIPTION

The fundamental architecture of MACH 4 devices (Figure 1) consists of multiple optimized PAL® blocks interconnected by a central switch matrix. The central switch matrix allows communication between PAL blocks and routes inputs to the PAL blocks. Together, the PAL blocks and central switch matrix allow the logic designer to create large designs in a single device instead of having to use multiple devices.

The key to being able to make effective use of these devices lies in the interconnect schemes. In MACH 4 architecture, the macrocells have been decoupled from the product terms through the logic allocator, and the I/O pins have been decoupled from the macrocells due to the output switch matrix. In addition, more input routing options are provided by the input switch matrix. These resources provide the flexibility needed to fit designs efficiently.



17466F-001

Figure 1. MACH 4 Block Diagram and PAL Block Structure

Notes:

1. *16 for M4(LV)-32/32 and M4A(3,5)-32/32 devices.*
2. *Block clocks do not go to I/O cells in M4(LV)-32/32 or M4A(3,5)-32/32.*
3. *M4(LV)-192/96, M4(LV)-256/128, M4A(3,5)-192/96 and M4A(3,5)-256/128 have dedicated clock pins which cannot be used as inputs and do not connect to the central switch matrix.*

The central switch matrix takes all dedicated inputs and signals from the input switch matrices and routes them as needed to the PAL blocks. Feedback signals that return to the same PAL block still must go through the central switch matrix. This mechanism ensures that PAL blocks in MACH 4 devices communicate with each other with consistent, predictable delays.

The central switch matrix makes a MACH 4 device more advanced than simply several PAL devices on a single chip. It allows the designer to think of the device not as a collection of blocks, but as a single programmable device; the software partitions the design into PAL blocks through the central switch matrix so that the designer does not have to be concerned with the internal architecture of the device.

Each PAL block consists of:

- Product-term array
- Logic allocator
- Macrocells
- Output switch matrix
- I/O cells
- Input switch matrix
- Clock generator

Product-Term Array

The product-term array consists of a number of product terms that form the basis of the logic being implemented. The inputs to the AND gates come from the central switch matrix (Table 7), and are provided in both true and complement forms for efficient logic implementation.

Table 7. PAL Block Inputs

Device	Number of Inputs to PAL Block
M4(LV)-32/32 and M4A(3,5)-32/32	33
M4(LV)-64/32 and M4A(3,5)-64/32	33
M4(LV)-96/48 and M4A(3,5)-96/48	33
M4(LV)-128/64 and M4A(3,5)-128/64	33
M4(LV)-128N/64	33
M4(LV)-192/96 and M4A(3,5)-192/96	34
M4(LV)-256/128 and M4A(3,5)-256/128	34
M4A3-384/192	36
M4A3-512/256	36

Because the number of product terms available for a given logic function is not fixed, the full sum of products is not realized in the array. The product terms drive the logic allocator, which allocates the appropriate number of product terms to generate the function.

Logic Allocator

Within the logic allocator, product terms are allocated to macrocells in “product term clusters.” The availability and distribution of product term clusters are automatically considered by the software as it fits functions within a PAL block. The size of a product term cluster has been optimized to provide high utilization of product terms, making complex functions using many product terms possible. Yet when few product terms are used, there will be a minimal number of

unused—or wasted—product terms left over. The product term clusters available to each macrocell within a PAL block are shown in Tables 8 and 9.

Each product term cluster is associated with a macrocell. The size of a cluster depends on the configuration of the associated macrocell. When the macrocell is used in synchronous mode (Figure 2a), the basic cluster has 4 product terms. When the associated macrocell is used in asynchronous mode (Figure 2b), the cluster has 2 product terms. Note that if the product term cluster is routed to a different macrocell, the allocator configuration is not determined by the mode of the macrocell actually being driven. The configuration is always set by the mode of the macrocell that the cluster will drive if not routed away, regardless of the actual routing.

In addition, there is an extra product term that can either join the basic cluster to give an extended cluster, or drive the second input of an exclusive-OR gate in the signal path. If included with the basic cluster, this provides for up to 20 product terms on a synchronous function that uses four extended 5-product-term clusters. A similar asynchronous function can have up to 18 product terms.

When the extra product term is used to extend the cluster, the value of the second XOR input can be programmed as a 0 or a 1, giving polarity control. The possible configurations of the logic allocator are shown in Figures 3 and 4.

b. Asynchronous Mode

17466F-006

Figure 2. Logic Allocator: Configuration of Cluster "n" Set by Mode of Macrocell "n"

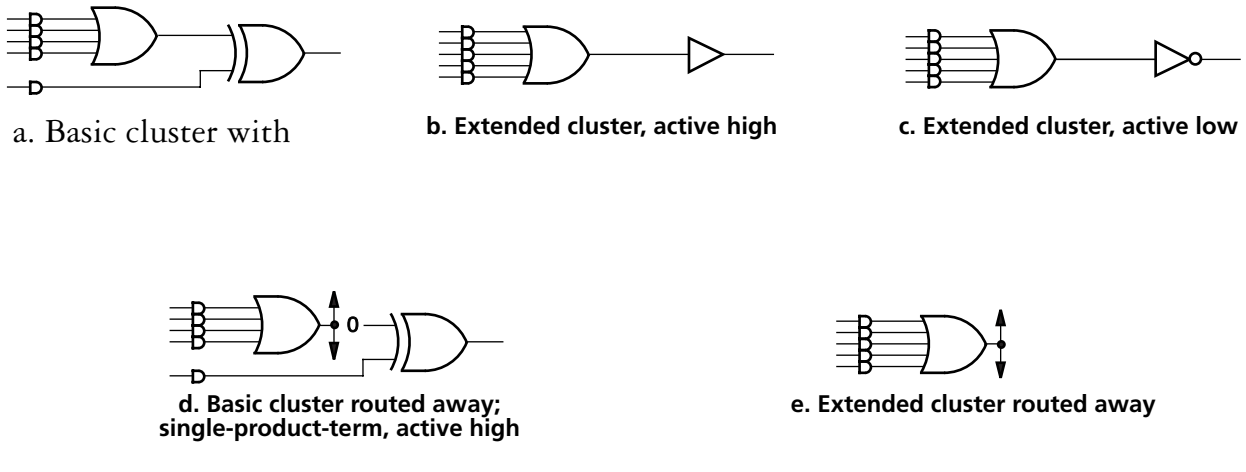

Figure 3. Logic Allocator Configurations: Synchronous Mode

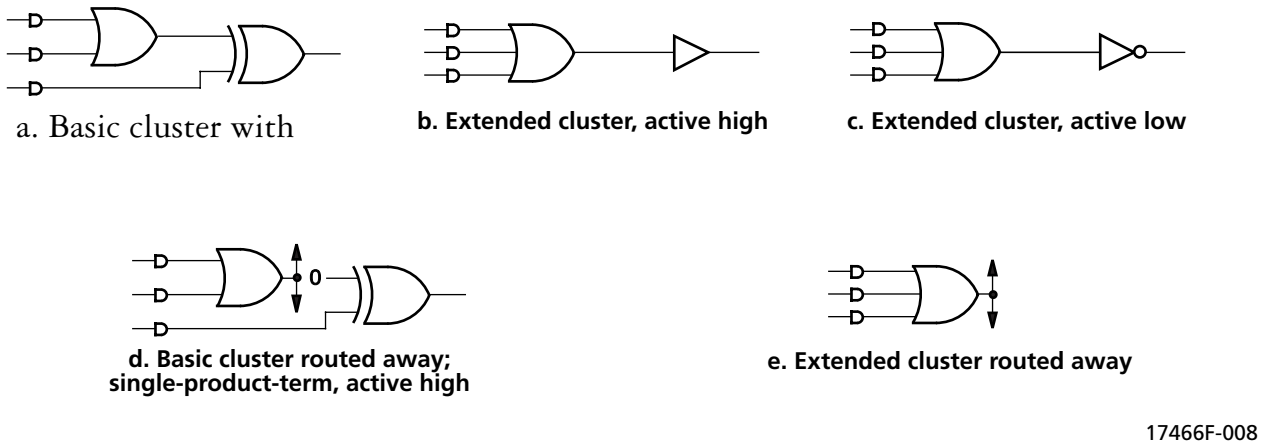

Figure 4. Logic Allocator Configurations: Asynchronous Mode

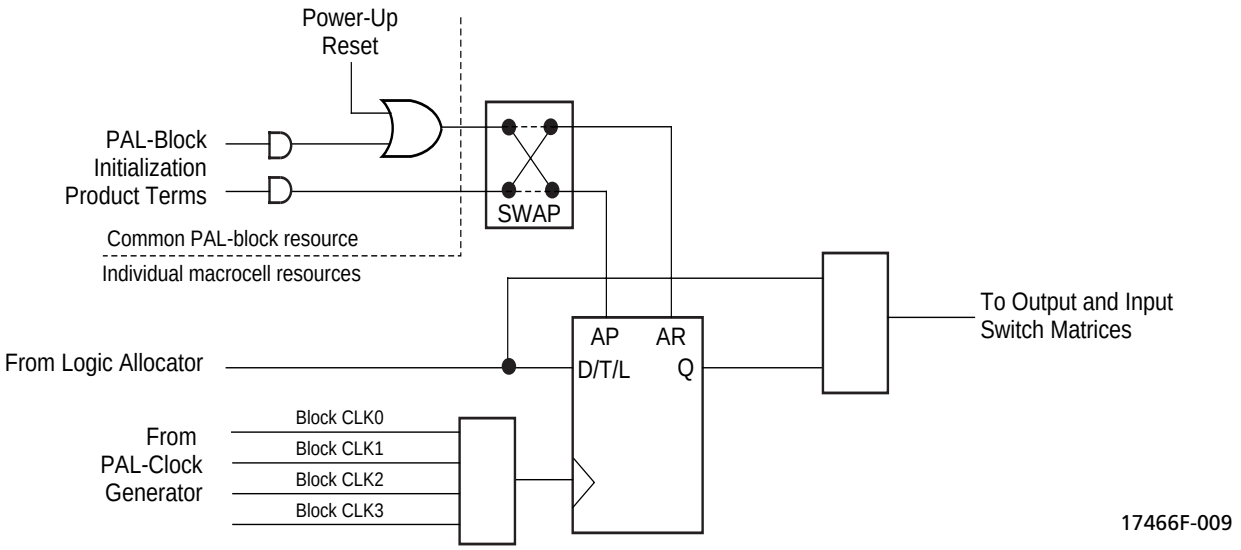
Note that the configuration of the logic allocator has absolutely no impact on the speed of the signal. All configurations have the same delay. This means that designers do not have to decide between optimizing resources or speed; both can be optimized.

If not used in the cluster, the extra product term can act in conjunction with the basic cluster to provide XOR logic for such functions as data comparison, or it can work with the D-,T-type flip-flop to provide for J-K, and S-R register operation. In addition, if the basic cluster is routed to another macrocell, the extra product term is still available for logic. In this case, the first XOR input will be a logic 0. This circuit has the flexibility to route product terms elsewhere without giving up the use of the macrocell.

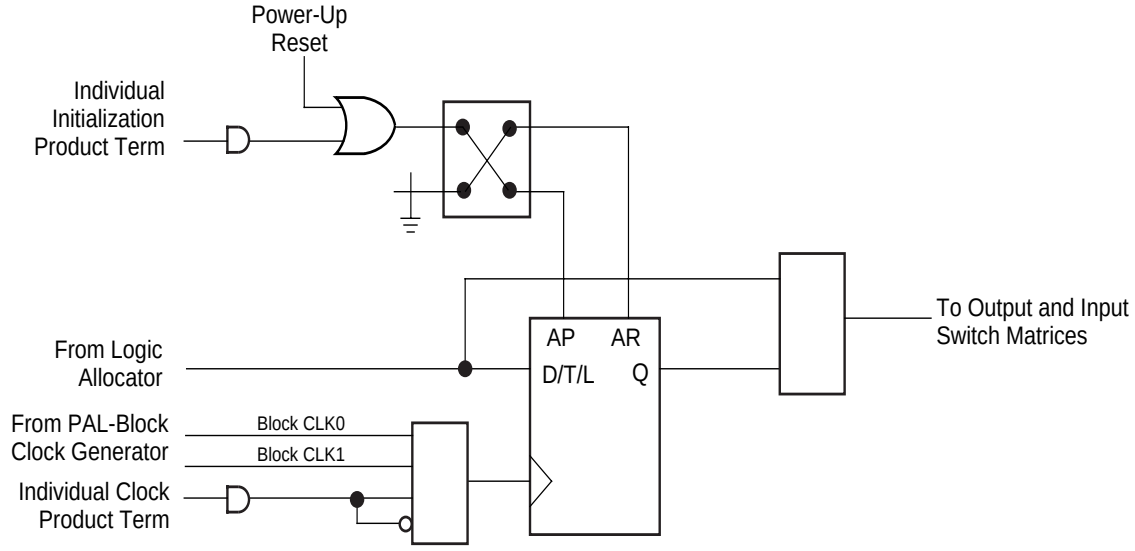
Product term clusters do not "wrap" around a PAL block. This means that the macrocells at the ends of the block have fewer product terms available.

Macrocell

The macrocell consists of a storage element, routing resources, a clock multiplexer, and initialization control. The macrocell has two fundamental modes: synchronous and asynchronous (Figure 5). The mode chosen only effects clocking and initialization in the macrocell.



a. Synchronous mode



b. Asynchronous mode

Figure 5. Macrocell

In either mode, a combinatorial path can be used. For combinatorial logic, the synchronous mode will generally be used, since it provides more product terms in the allocator.

The flip-flop can be configured as a D-type or T-type latch. J-K or S-R registers can be synthesized. The primary flip-flop configurations are shown in Figure 6, although others are possible. Flip-flop functionality is defined in Table 10. Note that a J-K latch is inadvisable as it will cause oscillation if both J and K inputs are HIGH.

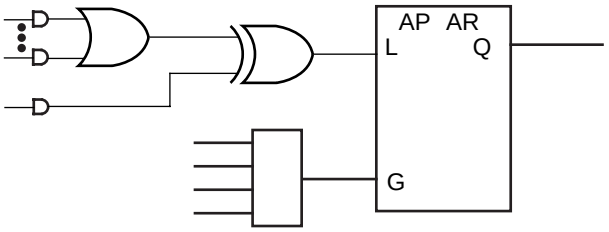
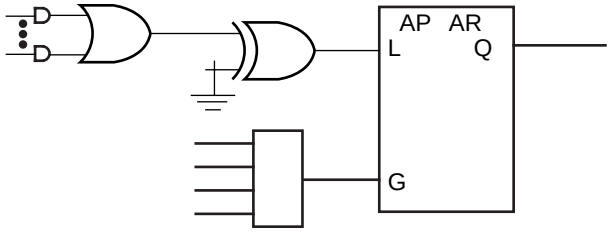
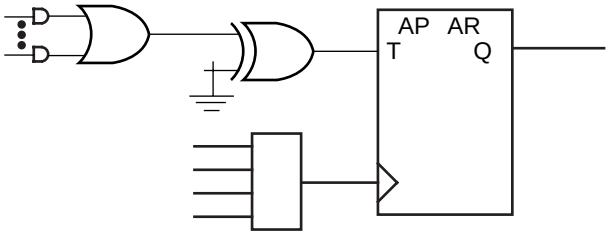
b. D-type with programmable D polarity



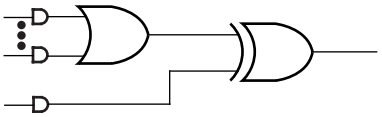
c. Latch with XOR



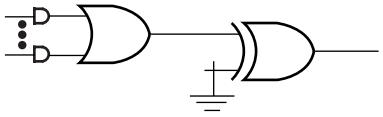
d. Latch with programmable D polarity



e. T-type with programmable T polarity



f. Combinatorial with XOR



g. Combinatorial with programmable polarity

17466F-011

Figure 6. Primary Macrocell Configurations

Table 10. Register/Latch Operation

Configuration	Input(s)	CLK/LE [1]	Q+
D-type Register	D=X	0, 1, ↓ (↑)	Q
	D=0	↑ (↓)	0
	D=1	↑ (↓)	1
T-type Register	T=X	0, 1, ↓ (↑)	Q
	T=0	↑ (↓)	Q
	T=1	↑ (↓)	$\overline{Q}$
D-type Latch	D=X	1 (0)	Q
	D=0	0 (1)	0
	D=1	0 (1)	1

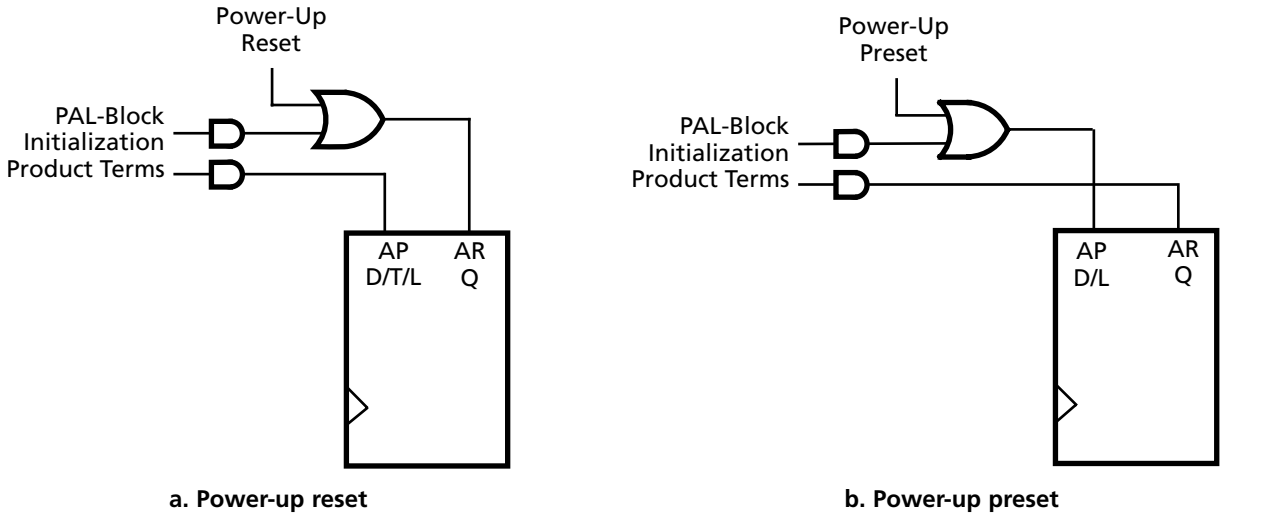
Note:

1. Polarity of CLK/LE can be programmed

Although the macrocell shows only one input to the register, the XOR gate in the logic allocator allows the D-, T-type register to emulate J-K, and S-R behavior. In this case, the available product terms are divided between J and K (or S and R). When configured as J-K, S-R, or T-type, the extra product term must be used on the XOR gate input for flip-flop emulation. In any register type, the polarity of the inputs can be programmed.

The clock input to the flip-flop can select any of the four PAL block clocks in synchronous mode, with the additional choice of either polarity of an individual product term clock in the asynchronous mode.

The initialization circuit depends on the mode. In synchronous mode (Figure 7), asynchronous reset and preset are provided, each driven by a product term common to the entire PAL block.



a. Power-up reset

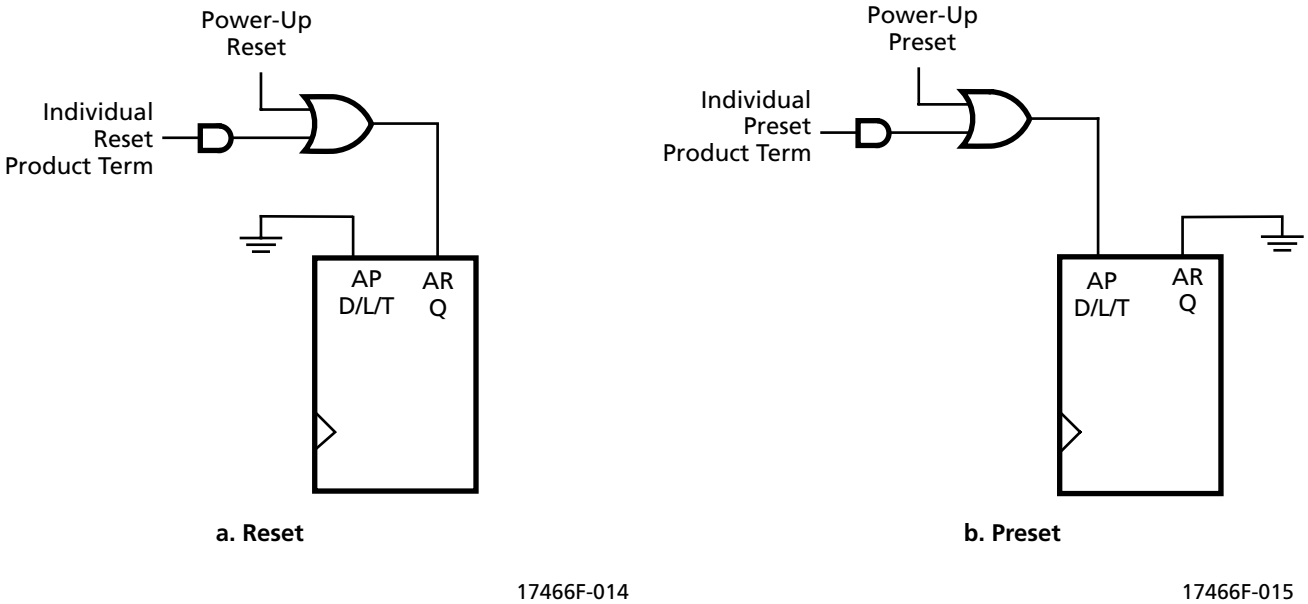
17466F-012

b. Power-up preset

17466F-013

Figure 7. Synchronous Mode Initialization Configurations

A reset/preset swapping feature in each macrocell allows for reset and preset to be exchanged, providing flexibility. In asynchronous mode (Figure 8), a single individual product term is provided for initialization. It can be selected to control reset or preset.



a. Reset **b. Preset**

17466F-014 17466F-015

Figure 8. Asynchronous Mode Initialization Configurations

Note that the reset/preset swapping selection feature effects power-up reset as well. The initialization functionality of the flip-flops is illustrated in Table 11. The macrocell sends its data to the output switch matrix and the input switch matrix. The output switch matrix can route this data to an output if so desired. The input switch matrix can send the signal back to the central switch matrix as feedback.

Table 11. Asynchronous Reset/Preset Operation

AR	AP	CLK/LE[1]	Q+
0	0	X	See Table 10
0	1	X	1
1	0	X	0
1	1	X	0

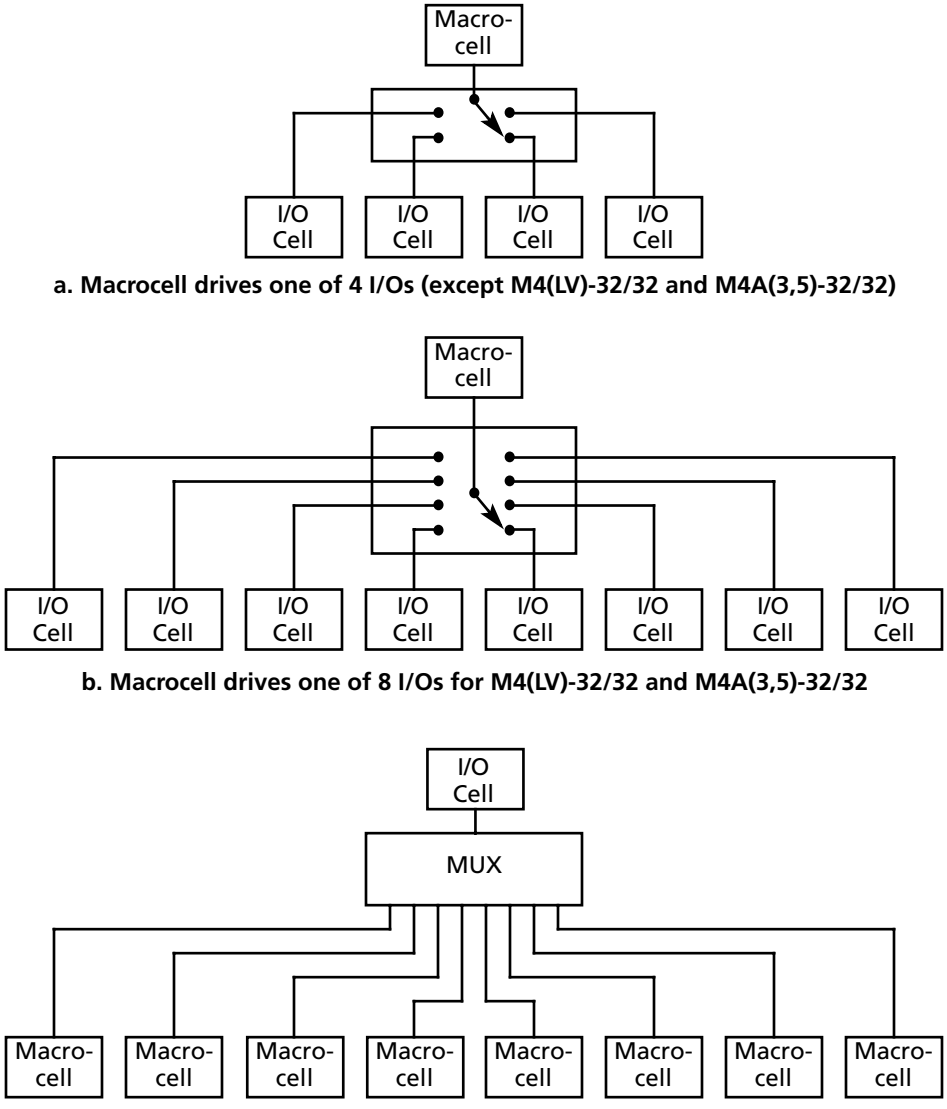
Note:

1. Transparent latch is unaffected by AR, AP

Output Switch Matrix

The output switch matrix allows macrocells to be connected to any of several I/O cells within a PAL block. This provides high flexibility in determining pinout and allows design changes to occur without effecting pinout.

In MACH 4 devices (except M4(LV)-32/32 and M4A(3,5)-32/32), each PAL block has twice as many macrocells as I/O cells. The MACH 4 output switch matrix allows for half of the macrocells to drive I/O cells within a PAL block, in combinations according to Figure 9. Each I/O cell can choose from eight macrocells; each macrocell has a choice of four I/O cells. The M4(LV)-32/32 and M4A(3,5)-32/32 allow every macrocell to drive an I/O cell (Figures 12 and 13).



a. Macrocell drives one of 4 I/Os (except M4(LV)-32/32 and M4A(3,5)-32/32)

b. Macrocell drives one of 8 I/Os for M4(LV)-32/32 and M4A(3,5)-32/32

c. I/O can choose one of 8 macrocells

I/O Cell

The I/O cell (Figures 10 and 11) simply consists of a programmable output enable, a feedback path, and in all but the M4(LV)-32/32 and the M4A(3,5)-32/32 devices, a flip-flop. An individual output enable product term is provided for each I/O cell. The feedback signal drives the input switch matrix.

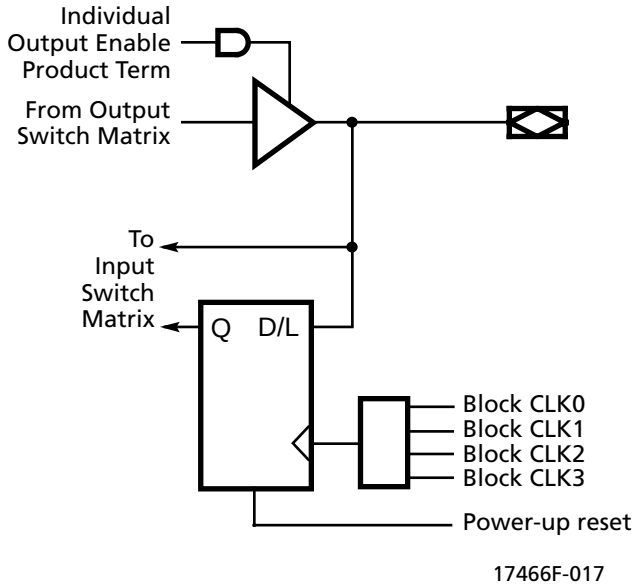

Figure 10. I/O Cell for MACH 4 Devices (except M4(LV)-32/32 and M4A(3,5)-32/32)

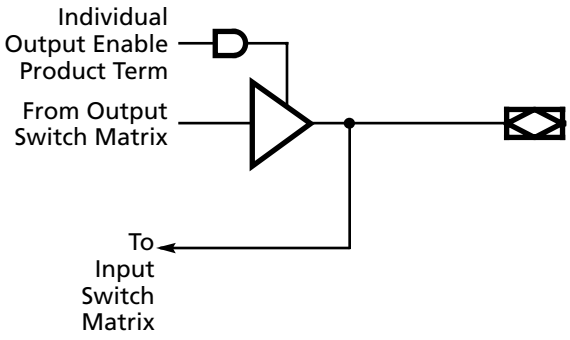

Figure 11. I/O Cell for M4(LV)-32/32 and M4A(3,5)-32/32

The MACH 4 I/O cell contains a flip-flop, which provides the capability for storing the input in a D-type register or latch. The clock can be any of the PAL block clocks. Both the direct and registered versions of the input are sent to the input switch matrix. This allows for such functions as "time-domain-multiplexed" data comparison, where the first data value is stored, and then the second data value is put on the I/O pin and compared with the previous stored value.

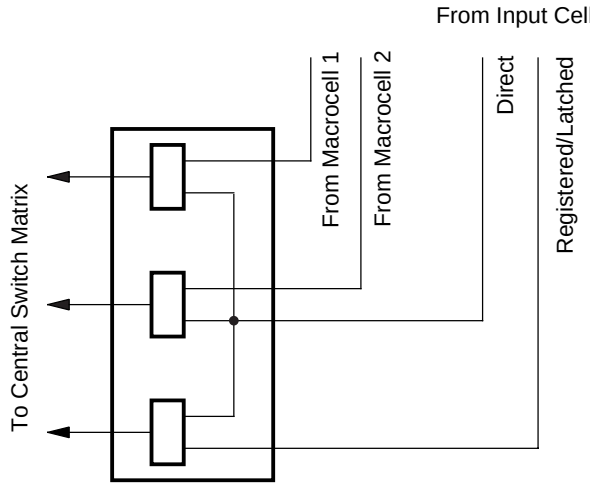
Note that the flip-flop used in the MACH 4 I/O cell is independent of the flip-flops in the macrocells. It powers up to a logic low.

Zero-Hold-Time Input Register

The MACH 4 devices have a zero-hold-time (ZHT) fuse which controls the time delay associated with loading data into all I/O cell registers and latches. When programmed, the ZHT fuse increases the data path setup delays to input storage elements, matching equivalent delays in the clock path. When the fuse is erased, the setup time to the input storage element is minimized. This feature facilitates doing worst-case designs for which data is loaded from sources which have low (or zero) minimum output propagation delays from clock edges.

Input Switch Matrix

The input switch matrix (Figures 12 and 13) optimizes routing of inputs to the central switch matrix. Without the input switch matrix, each input and feedback signal has only one way to enter the central switch matrix. The input switch matrix provides additional ways for these signals to enter the central switch matrix.



Note: except M4(LV)-32/32 and M4A(3,5)-32/32

17466F-002

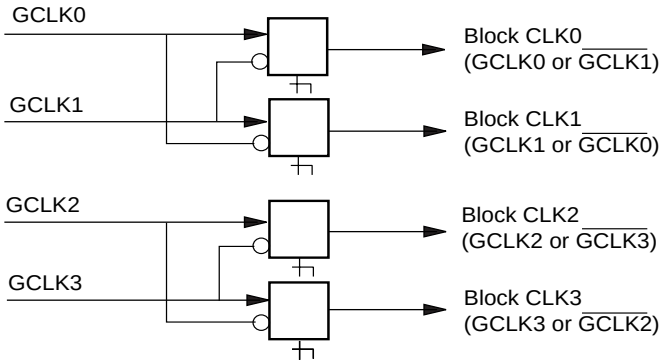
Figure 13. M4(LV)-32/32 and M4A(3,5)-32/32 Input Switch Matrix

PAL Block Clock Generation

Each MACH 4 device has four clock pins that can also be used as inputs. These pins drive a clock generator in each PAL block (Figure 14). The clock generator provides four clock signals that can be used anywhere in the PAL block. These four PAL block clock signals can consist of a large number of combinations of the true and complement edges of the global clock signals. Table 14 lists the possible combinations.



17466F-004

Figure 14. PAL Block Clock Generator [1]

Note:

1. *M4(LV)-32/32, M4A(3,5)-32/32, M4(LV)-64/32 and M4A(3,5)-64/32 have only two clock pins, GCLK0 and GCLK1. GCLK2 is tied to GCLK0, and GCLK3 is tied to GCLK1.*

Table 14. PAL Block Clock Combinations[1]

Block CLK0	Block CLK1	Block CLK2	Block CLK3
GCLK0	GCLK1	X	X
$\overline{\text{GCLK1}}$	GCLK1	X	X
GCLK0	$\overline{\text{GCLK0}}$	X	X
$\overline{\text{GCLK1}}$	$\overline{\text{GCLK0}}$	X	X
X	X	GCLK2 (GCLK0)	GCLK3 (GCLK1)
X	X	$\overline{\text{GCLK3}}$ ($\overline{\text{GCLK1}}$)	GCLK3 (GCLK1)
X	X	GCLK2 (GCLK0)	$\overline{\text{GCLK2}}$ ($\overline{\text{GCLK0}}$)
X	X	$\overline{\text{GCLK3}}$ ($\overline{\text{GCLK1}}$)	$\overline{\text{GCLK2}}$ ($\overline{\text{GCLK0}}$)

Note:

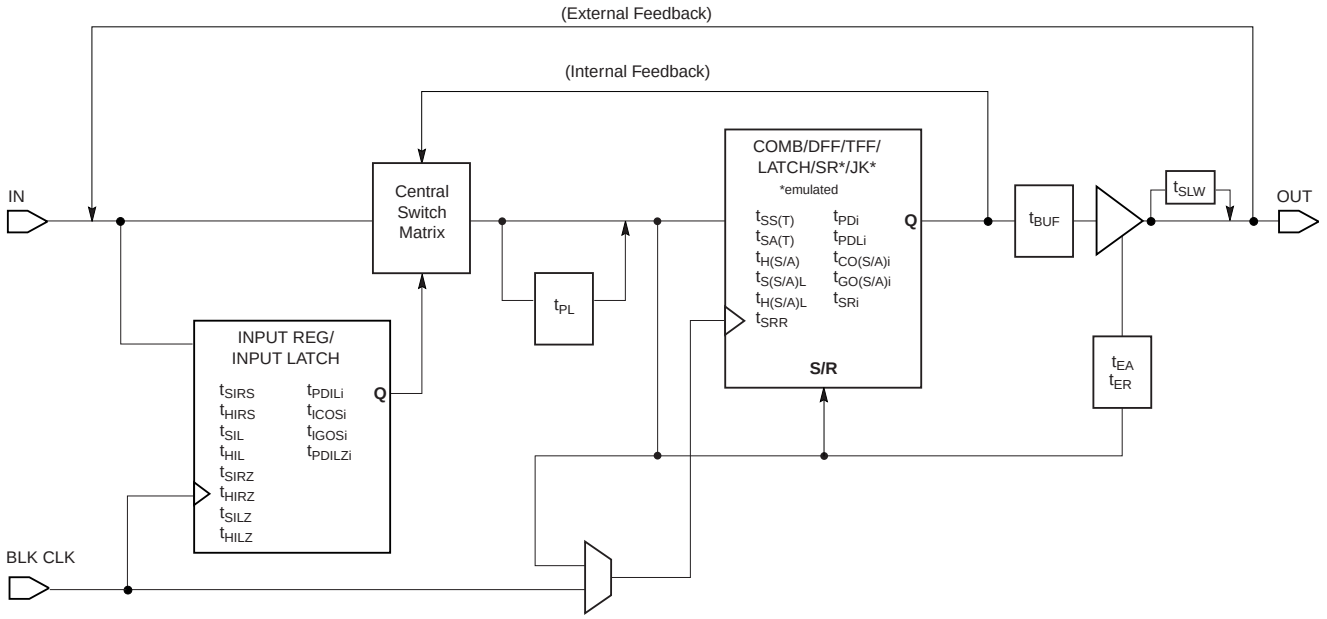
1. Values in parentheses are for the M4(LV)-32/32, M4A(3,5)-32/32, M4(LV)-64/32 and M4A(3,5)-64/32.

This feature provides high flexibility for partitioning state machines and dual-phase clocks. It also allows latches to be driven with either polarity of latch enable, and in a master-slave configuration.

MACH 4 TIMING MODEL

The primary focus of the MACH 4 timing model is to accurately represent the timing in a MACH 4 device, and at the same time, be easy to understand. This model accurately describes all combinatorial and registered paths through the device, making a distinction between **internal feedback** and **external feedback**. A signal uses internal feedback when it is fed back into the switch matrix or block without having to go through the output buffer. The input register specifications are also reported as internal feedback. When a signal is fed back into the switch matrix after having gone through the output buffer, it is using external feedback.

The parameter, t_{BUF}, is defined as the time it takes to go from feedback through the output buffer to the I/O pad. If a signal goes to the internal feedback rather than to the I/O pad, the parameter designator is followed by an "i". By adding t_{BUF} to this internal parameter, the external parameter is derived. For example, $t_{PD} = t_{PDi} + t_{BUF}$. A diagram representing the modularized MACH 4 timing model is shown in Figure 15. Refer to the Technical Note entitled *MACH 4 Timing and High Speed Design* for a more detailed discussion about the timing parameters.



17466F-025

Figure 15. MACH 4 Timing Model

SPEEDLOCKING FOR GUARANTEED FIXED TIMING

The MACH 4 architecture allows allocation of up to 20 product terms to an individual macrocell with the assistance of an XOR gate without incurring additional timing delays.

The design of the switch matrix and PAL blocks guarantee a fixed pin-to-pin delay that is independent of the logic required by the design. Other non-Vantis CPLDs incur serious timing delays as product terms expand beyond their typical 4 or 5 product term limits. Speed *and* SpeedLocking combine to give designs easy access to the performance required in today's designs.

JTAG BOUNDARY SCAN TESTABILITY

All MACH 4 devices, except the M4(LV)-128N/64, have JTAG boundary scan cells and are compliant to the JTAG standard, IEEE 1149.1. This allows functional testing of the circuit board on which the device is mounted through a serial scan path that can access all critical logic nodes. Internal registers are linked internally, allowing test data to be shifted in and loaded directly onto test nodes, or test node data to be captured and shifted out for verification. In addition, these devices can be linked into a board-level serial scan path for more complete board-level testing.

JTAG IN-SYSTEM PROGRAMMING

Programming devices in-system provides a number of significant benefits including: rapid prototyping, lower inventory levels, higher quality, and the ability to make in-field modifications. All MACH 4 devices provide In-System Programming (ISP) capability through their JTAG ports. This capability has been implemented in a manner that ensures that the JTAG port remains compliant to the IEEE 1149.1 standard. By using JTAG as the communication interface through which ISP is achieved, customers get the benefit of a standard, well-defined interface.

MACH 4 devices can be programmed across the commercial temperature and voltage range. Vantis provides its free PC-based VantisPRO software to facilitate in-system programming. VantisPRO takes the JEDEC file output produced by Vantis' design implementation software, along with information about the JTAG chain, and creates a set of vectors that are used to drive the JTAG chain. VantisPRO software can use these vectors to drive a JTAG chain via the parallel port of a PC. Alternatively, VantisPRO software can output files in formats understood by common automated test equipment. This equpment can then be used to program MACH 4 devices during the testing of a circuit board. For more information about in-system programming, refer to the separate document entitled *MACH ISP Manual*.

PCI COMPLIANT

MACH 4(A) devices in the -50/-55/-60/-65/-7/-10/-12 speed grades are compliant with the *PCI Local Bus Specification* version 2.1, published by the PCI Special Interest Group (SIG). The 5-V devices are fully PCI-compliant. The 3.3-V devices are mostly compliant but do not meet the PCI condition to clamp the inputs as they rise above V_{CC} because of their 5-V input tolerant feature.

SAFE FOR MIXED SUPPLY VOLTAGE SYSTEM DESIGNS

Both the 3.3-V and 5-V V_{CC} MACH 4 devices are safe for mixed supply voltage system designs. The 5-V devices will not overdrive 3.3-V devices above the output voltage of 3.3 V, while they accept inputs from other 3.3-V devices. The 3.3-V device will accept inputs up to 5.5 V. Both the 5-V and 3.3-V versions have the same high-speed performance and provide easy-to-use mixed-voltage design capability.

PULL UP OR BUS-FRIENDLY INPUTS AND I/OS

All MACH 4 devices have inputs and I/Os which feature the Bus-Friendly circuitry incorporating two inverters in series which loop back to the input. This double inversion weakly holds the input at its last driven logic state. While it is good design practice to tie unused pins to a known state, the Bus-Friendly input structure pulls pins away from the input threshold voltage where noise can cause high-frequency switching. At power-up, the Bus-Friendly latches are reset to a logic level

"1." For the circuit diagram, please refer to the *Input/Output Equivalent Schematics (page 393)* in the General Information Section of the Vantis 1999 Data Book.

All MACH 4A devices have a programmable bit that configures all inputs and I/Os with either pull-up or Bus-Friendly characteristics. If the device is configured in pull-up mode, all inputs and I/O pins are weakly pulled up. For the circuit diagram, please refer to the *Input/Output Equivalent Schematics (page 393)* in the General Information Section of the Vantis 1999 Data Book.

POWER MANAGEMENT

Each individual PAL block in MACH 4 devices features a programmable low-power mode, which results in power savings of up to 50%. The signal speed paths in the low-power PAL block will be slower than those in the non-low-power PAL block. This feature allows speed critical paths to run at maximum frequency while the rest of the signal paths operate in the low-power mode.

PROGRAMMABLE SLEW RATE

Each MACH 4 device I/O has an individually programmable output slew rate control bit. Each output can be individually configured for the higher speed transition (3 V/ns) or for the lower noise transition (1 V/ns). For high-speed designs with long, unterminated traces, the slow-slew rate will introduce fewer reflections, less noise, and keep ground bounce to a minimum. For designs with short traces or well terminated lines, the fast slew rate can be used to achieve the highest speed. The slew rate is adjusted independent of power.

POWER-UP RESET/SET

All flip-flops power up to a known state for predictable system initialization. If a macrocell is configured to SET on a signal from the control generator, then that macrocell will be SET during device power-up. If a macrocell is configured to RESET on a signal from the control generator or is not configured for set/reset, then that macrocell will RESET on power-up. To guarantee initialization values, the V_{CC} rise must be monotonic, and the clock must be inactive until the reset delay time has elapsed.

SECURITY BIT

A programmable security bit is provided on the MACH 4 devices as a deterrent to unauthorized copying of the array configuration patterns. Once programmed, this bit defeats readback of the programmed pattern by a device programmer, securing proprietary designs from competitors. Programming and verification are also defeated by the security bit. The bit can only be reset by erasing the entire device.

HOT SOCKETING

MACH 4A devices are well-suited for those applications that require hot socketing capability. Hot socketing a device requires that the device, when powered down, can tolerate active signals on the I/Os and inputs without being damaged. Additionally, it requires that the effects of the powered-down MACH devices be minimal on active signals.

ABSOLUTE MAXIMUM RATINGS

M4 and M4A5

Storage Temperature . . . . . -65°C to +150°C

Ambient Temperature
with Power Applied . . . . . -5°C to +100°C

Device Junction Temperature . . . . . +130°C

Supply Voltage
with Respect to Ground . . . . . -0.5 V to +7.0 V

DC Input Voltage . . . . . -0.5 V to V_{CC} + 0.5 V

Static Discharge Voltage . . . . . 2000 V

Latchup Current (T_A = -40°C to +85°C). . . . . 200 mA

Stresses above those listed under Absolute Maximum Ratings may cause permanent device failure. Functionality at or above these limits is not implied. Exposure to Absolute Maximum Ratings for extended periods may affect device reliability.

OPERATING RANGES

Commercial (C) Devices

Ambient Temperature (T_A)
Operating in Free Air . . . . . 0°C to +70°C

Supply Voltage (V_{CC})
with Respect to Ground . . . . . +4.75 V to +5.25 V

Industrial (I) Devices

Ambient Temperature (T_A)
Operating in Free Air . . . . . -40°C to +85°C

Supply Voltage (V_{CC})
with Respect to Ground . . . . . +4.50 V to +5.5 V

Operating ranges define those limits between which the functionality of the device is guaranteed.

5-V DC CHARACTERISTICS OVER OPERATING RANGES

Parameter Symbol	Parameter Description	Test Conditions	Min	Typ	Max	Unit
V_{OH}	Output HIGH Voltage	I_{OH} = –3.2 mA, V_{CC} = Min, V_{IN} = V_{IH} or V_{IL}	2.4			V
		I_{OH} = 0 mA, V_{CC} = Max, V_{IN} = V_{IH} or V_{IL}			3.3	V
V_{OL}	Output LOW Voltage	I_{OL} = 24 mA, V_{CC} = Min, V_{IN} = V_{IH} or V_{IL} (Note 1)			0.5	V
V_{IH}	Input HIGH Voltage	Guaranteed Input Logical HIGH Voltage for all Inputs (Note 2)	2.0			V
V_{IL}	Input LOW Voltage	Guaranteed Input Logical LOW Voltage for all Inputs (Note 2)			0.8	V
I_{IH}	Input HIGH Leakage Current	V_{IN} = 5.25 V, V_{CC} = Max (Note 3)			10	µA
I_{IL}	Input LOW Leakage Current	V_{IN} = 0 V, V_{CC} = Max (Note 3)			–10	µA
I_{OZH}	Off-State Output Leakage Current HIGH	V_{OUT} = 5.25 V, V_{CC} = Max, V_{IN} = V_{IH} or V_{IL} (Note 3)			10	µA

Notes:

1. See "Switching Test Circuit" in the General Information Section of the Vantis 1999 Data Book.

2. This parameter does not apply to flip-flops in the emulated mode since the feedback path is required for emulation.

CAPACITANCE [1]

Parameter Symbol	Parameter Description	Test Conditions		Typ	Unit
C_{IN}	Input capacitance	V_{IN}=2.0 V	3.3 V or 5 V, 25°C, 1 MHz	6	pF
$C_{I/O}$	Output capacitance	V_{OUT}=2.0V	3.3 V or 5 V, 25°C, 1 MHz	8	pF

Note:

1. *These parameters are not 100% tested, but are calculated at initial characterization and at any time the design is modified where this parameter may be affected.*

I_{CC} vs. FREQUENCY

These curves represent the typical power consumption for a particular device at system frequency. The selected "typical" pattern is a 16-bit up-down counter. This pattern fills the device and exercises every macrocell. Maximum frequency shown uses internal feedback and a D-type register. Power/Speed are optimized to obtain the highest counter frequency and the lowest power. The highest frequency (LSBs) is placed in common PAL blocks, which are set to high power. The lowest frequency signals (MSBs) are placed in a common PAL block and set to lowest power.

PRODUCT ORDERING INFORMATION

MACH 4 Devices Commercial & Industrial - 3.3V and 5V

Vantis programmable logic products are available with several ordering options. The order number (Valid Combination) is formed by a combination of:

M4- 256 / 128 -7 Y C

FAMILY TYPE

M4- = MACH 4 Family (5-V V_{CC})
M4LV- = MACH 4 Family Low Voltage (3.3-V V_{CC})

MACROCELL DENSITY

32	= 32 Macrocells	128N	= 128 Macrocells, Non-ISP
64	= 64 Macrocells	192	= 192 Macrocells
96	= 96 Macrocells	256	= 256 Macrocells
128	= 128 Macrocells		

I/Os

/32 = 32 I/Os in 44-pin PLCC, 44-pin TQFP or 48-pin TQFP
/48 = 48 I/Os in 100-pin TQFP
/64 = 64 I/Os in 84-pin PLCC, 100-pin PQFP or 100-pin TQFP
/96 = 96 I/Os in 144-pin TQFP
/128 = 128 I/Os in 208-pin PQFP or 256-Pin BGA

SPEED

-7 = 7.5 ns t_{PD}
-10 = 10 ns t_{PD}
-12 = 12 ns t_{PD}
-14 = 14 ns t_{PD}
-15 = 15 ns t_{PD}
-18 = 18 ns t_{PD}

PACKAGE TYPE

A = Ball Grid Array (BGA)
J = Plastic Leaded Chip Carrier (PLCC)
V = Thin Quad Flat Pack (TQFP)
Y = Plastic Quad Flat Pack (PQFP)

OPERATING CONDITIONS

C = Commercial (0°C to +70°C)
I = Industrial (-40 °C to +85 °C)

48 = 48-pin TQFP for M4(LV)-32/32 or M4(LV)-64/32

Valid Combinations

M4LV-64/32		JC, VC, VC48
M4-96/48		VC
M4LV-96/48		VC
M4-128/64		YC, VC
M4LV-128/64		YC, VC
M4-128N/64		JC
M4LV-128N/64		JC
M4-192/96		VC
M4LV-192/96		VC
M4-256/128		YC, AC
M4LV-256/128		YC, AC

All MACH devices are dual-marked with both Commercial and Industrial grades. The Industrial speed grade is slower, i.e., M4-256/128-7YC-10YI

Valid Combinations		
M4-32/32	-10, -12, -14, -18	JI, VI, VI48
M4LV-32/32		JI, VI, VI48
M4-64/32		JI, VI, VI48
M4LV-64/32		JI, VI, VI48
M4-96/48		VI

M4-256/128		YI, AI
M4LV-256/128		YI, AI

Valid Combinations

Valid Combinations list configurations planned to be supported in volume for this device. Consult the local Vantis sales office to confirm availability of specific valid combinations and to check on newly released combinations.

PRODUCT ORDERING INFORMATION

MACH 4A Devices Commercial and Industrial - 3.3V and 5V

Vantis programmable logic products are available with several ordering options. The order number (Valid Combination) is formed by a combination of:

M4A3- 256 128 -7 Y C

FAMILY TYPE

M4A3- = MACH 4 Family Low Voltage Advanced Feature (3.3-V V_{CC})
M4A5- = MACH 4 Family Advanced Feature (5-V V_{CC})

MACROCELL DENSITY

32	= 32 Macrocells	192	= 192 Macrocells
64	= 64 Macrocells	256	= 256 Macrocells
96	= 96 Macrocells	384	= 384 Macrocells
128	= 96 Macrocells	512	= 512 Macrocells

I/Os

/32 = 32 I/Os in 44-pin PLCC, 44-pin TQFP or 48-pin TQFP
/48 = 48 I/Os in 100-pin TQFP
/64 = 64 I/Os in 100-pin TQFP or 100-pin PQFP
/96 = 96 I/Os in 144-pin TQFP
/128 = 128 I/Os in 176-pin TQFP, 208-pin PQFP, or 256-pin BGA
/160 = 160 I/Os in 208-pin PQFP
/192 = 192 I/Os in 256-pin BGA
/256 = 256 I/Os in 352-pin BGA

SPEED

-50 = 5.0 ns t_{PD}
-55 = 5.5 ns t_{PD}
-60 = 6.0 ns t_{PD}
-65 = 6.5 ns t_{PD}
-7 = 7.5 ns t_{PD}
-10 = 10 ns t_{PD}
-12 = 12 ns t_{PD}
-14 = 4 ns t_{PD}

PACKAGE TYPE

A = Ball Grid Array (BGA)
J = Plastic Leaded Chip Carrier (PLCC)
V = Thin Quad Flat Pack (TQFP)
Y = Plastic Quad Flat Pack (PQFP)

OPERATING CONDITIONS

C = Commercial (0°C to +70°C)
I = Industrial (-40 °C to +85 °C)

48 = 48-pin TQFP for M4A3-32/32 or M4A3-64/32 M4A5-32/32 or M4A5-64/32

Valid Combinations		
M4A3-32/32	-50, -55, -60, -65, -7, -10, -12	JC, VC, VC48
M4A5-32/32		JC, VC, VC48
M4A3-64/32		JC, VC, VC48
M4A5-64/32		JC, VC, VC48
M4A3-96/48		VC
M4A5-96/48		VC
M4A3-128/64		YC, VC
M4A5-128/64		YC, VC
M4A3-192/96		VC
M4A5-192/96		VC
M4A3-256/128		YC, AC
M4A5-256/128		YC, AC
M4A3-384/128		VC
M4A3-384/160		YC
M4A3-384/192		AC
M4A3-512/128		VC

All MACH devices are dual-marked with both Commercial and Industrial grades. The Industrial speed grade is slower, i.e., M4A3-256/128-7YC-10YI

Valid Combinations		
M4A3-32/32	-7, -10, -12, -14	JI, VI, VI48
