

Mobility

- ▶ Wireless traffic is easy to eavesdrop
- ▶ Requires new security solutions
- ▶ **Mobile phones:** Network operator may not be same as service provider
- ▶ We will look at
 - GSM
 - UMTS, 3GPP, LTE
 - WLAN

GSM - Introduction

- ▶ European standard, first deployed in 1991, still widely used
- ▶ Denoted 2G as it replaced NMT (1G)
- ▶ Security goals
 - Provide confidentiality for users – If the channel is eavesdropped it should not be possible to reconstruct messages.
 - Provide anonymity for users – It should not be possible to trace a user
 - Authenticate users – It should not be possible to spoof an identity
- ▶ Security requirements
 - Complexity added by security should be as small as possible
 - Bandwidth
 - Error rate
 - Overhead
 - Must be possible to use other networks in other countries

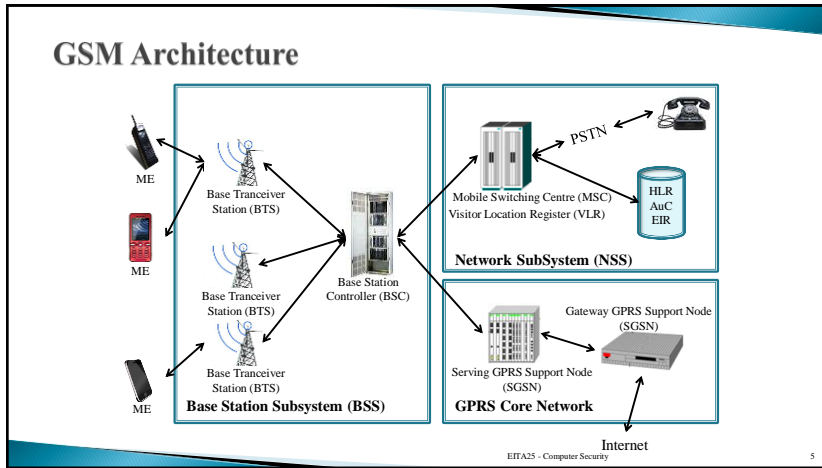

Mobile Station

- ▶ Consists of mobile equipment (ME)
 - Physical device
 - IMEI – International Mobile Equipment Identity
- ▶ SIM card – Subscriber Identity Module, Smart card with identifiers, keys and algorithms
 - K_i – Subscriber Authentication Key (Long term key)
 - IMSI – International Mobile Subscriber Identity
 - TMSI – Temporary Mobile Subscriber Identity
 - PIN – Personal Identity Number protecting a SIM
 - LAI – Location Area Identity

Some Important Parts of the Network

- ▶ *HLR – home location register*
 - Stores information about every SIM card issued by the operator. SIM identified by IMSI.
 - Stores current location of SIM
 - Sends data to VLR/SGSN when SIM roams
- ▶ *AuC – Authentication Center*
 - Manages authentication data for user
 - Stores K_i and algorithm ID (A3/A8)
 - Issues key for encryption
- ▶ *VLR – Visitor Location Register*
 - Serves a base station
 - Stores IMSI and TMSI
 - Updates HLR with location
- ▶ *EIR – Equipment Identity Register*
 - Keeps a list of banned IMEI
 - Used to track stolen phones

Subscriber Identity Protection

- ▶ If IMSI is always used for identification, then it is possible to track subscribers
 - Eavesdropping should not identify users
 - Network must identify users (someone has to pay the call)
- ▶ TMSI is used to identify a SIM
 - SIM card receives a TMSI
 - All other times → TMSI is used
- ▶ VLR maps TMSI → IMSI
- ▶ New MSC → new TMSI

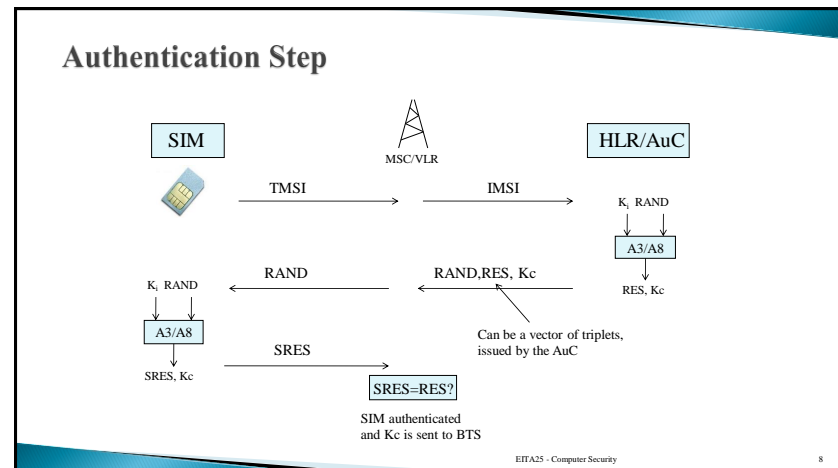

EITA25 - Computer Security 6

Authentication step

- ▶ K_i – subscriber identification key is stored in SIM and HLR/AuC
 - Size is 128 bits
- ▶ Goal
 - Authenticate subscriber to network
 - Create a session key
- ▶ Algorithm A3 computes response in authentication step
- ▶ Algorithm A8 computes 64-bit session key
- ▶ RAND is 128 bits, generated by AuC
- ▶ (S)RES is 32 bits

$K_i, RAND$	$K_i, RAND$
↓	↓
A3	A8
↓	↓
(S)RES	Kc

EITA25 - Computer Security 7

A3/A8

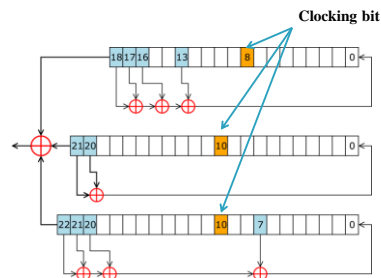

- ▶ A3 and A8 are implemented on the SIM
- ▶ Can be network specific, but example algorithms are proposed (COMP128)
- ▶ Independent of hardware manufacturers
- ▶ COMP128 was very weak.
 - Using Smart Card reader it was possible to get K_i
 - Possible to clone SIM cards
 - New versions were proposed

Encryption

- ▶ Encryption algorithms
 - A5/1 – Strong version
 - A5/2 – Weak version
 - A5/3 – Strong version (introduced later and based on Kasumi used in 3G)
- ▶ Traffic only encrypted between mobile station and base station

A5/1

Initialization: Load key and frame number by xoring them with bit 0
Keystream generation: Register is clocked if clocking bit is majority bit.

Note the small state:

Time-memory tradeoff feasible! (Some known plaintext is needed)

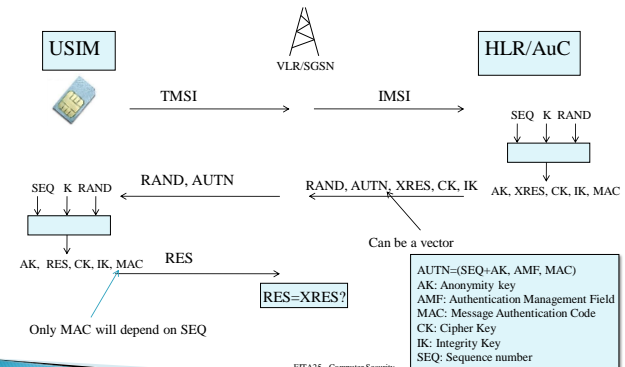

Secrecy of algorithms

- ▶ **Kerckhoffs' principle** – The secrecy of a message should only depend on the secret key!
- ▶ This well known principle from the 19th century was ignored
- ▶ If the algorithm is not investigated by public/researchers before deployment, how can we know it is secure?
 - COMP128 leaked out – was broken
 - A5/1 leaked out – was broken
- ▶ **Another problem with GSM:** Only users are authenticated, the network is not
 - Fake basestations can trick phones to send IMSI and/or turn off encryption

UMTS

- ▶ Developed by 3GPP (3rd generation partnership project)
 - Partners from Asia, Europe and North America
- ▶ First specification frozen 2000
- ▶ As far as we are concerned the architecture of UMTS is similar to the architecture of GSM
 - USIM – Universal subscriber identity module
 - Secret key K shared between USIM and HLR/AuC
- ▶ Goal of authentication step
 - Authenticate user
 - Create session key for encryption
 - **Authenticate network**
 - **Create session key for message authentication**
- ▶ **Do not keep algorithms secret**
- ▶ **128 bit session key**

Authentication and Key Agreement

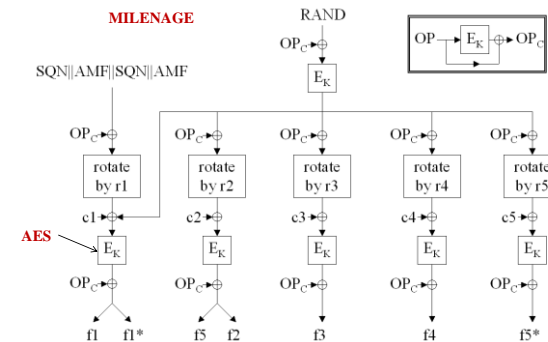

Functions used

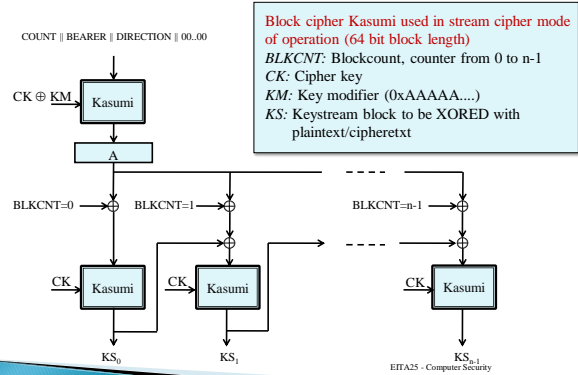

- ▶ f0: Random number generator
- ▶ f1: Network authentication function. computes a MAC that is part of AUTN
- ▶ f2: User authentication function. Computes RES and XRES
- ▶ f3: Cipher key derivation function
- ▶ f4: Integrity key derivation function
- ▶ f5: Anonymity key derivation function. Used to hide sequence number
- ▶ f8: Stream cipher for session encryption
- ▶ f9: MAC for session integrity protection

- ▶ f0 implemented in AuC
- ▶ f1-f5 are operator specific and implemented in USIM
- ▶ f8-f9 are mandatory for everyone and implemented in user equipment (phone)

Functions computed in AuC and USIM

Encryption in UMTS (f8)

Message Authentication, CBC-MAC

- ▶ CBC-MAC – Block cipher in CBC mode with last ciphertext as MAC value

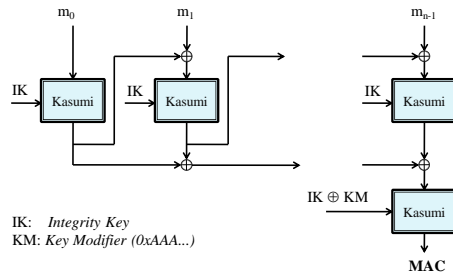

Problem with this construction:

Get message/MAC pair of a one-block message (m,t)

Then m || m+t also has MAC t,
 → (m || m+t, t) is a valid pair

MAC used in UMTS (f9)

- ▶ Only signalling data is authenticated
- ▶ CBC-MAC with output permutation and extra large state

LTE (4G)

- ▶ New generation, new features
- ▶ Quite different network, new names
 - Everything is packet switched
- ▶ Developed by 3GPP, constantly evolving with enhancements.
 - LTE is release 8 (2008)
 - LTE advanced is release 10 (2011)
 - LTE Advanced Pro is release 13 and 14 (2016)
 - 5G phase 1 and 2 are releases 15 and 16 (2018+)

3GPP Releases

Release Code	Name	Status	Start date	End date
Rel-17	Release 17	Open	2018-06-15	
Rel-16	Release 16	Open	2017-03-22	2020-06-19 (SA#88)
Rel-15	Release 15	Frozen	2016-06-01	2019-06-07 (SA#84)
Rel-14	Release 14	Frozen	2014-09-17	2017-06-09 (SA#76)
Rel-13	Release 13	Frozen	2012-09-30	2016-03-11 (SA#71)
Rel-12	Release 12	Frozen	2011-06-26	2015-03-13 (SA#67)
Rel-11	Release 11	Frozen	2010-01-22	2013-03-06 (SA#59)
Rel-10	Release 10	Frozen	2009-01-20	2011-06-08 (SA#52)
Rel-9	Release 9	Frozen	2008-03-06	2010-03-25 (SA#47)
Rel-8	Release 8	Frozen	2006-01-23	2009-03-12 (SA#43)

Security in LTE

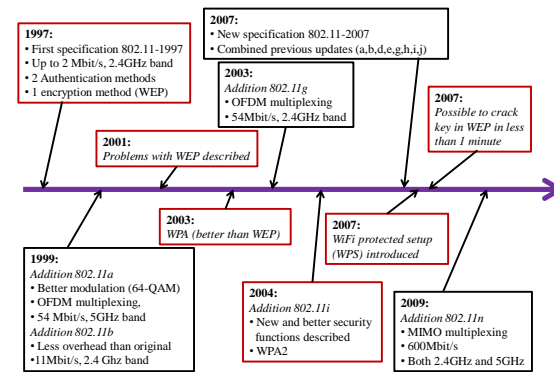

- ▶ Very similar authentication and key agreement as in UMTS
- ▶ AES has replaced Kasumi as confidentiality algorithm.
- ▶ New variant of Milenage proposed (based on SHA-3)
- ▶ Support for 256-bit symmetric keys

WLAN Security

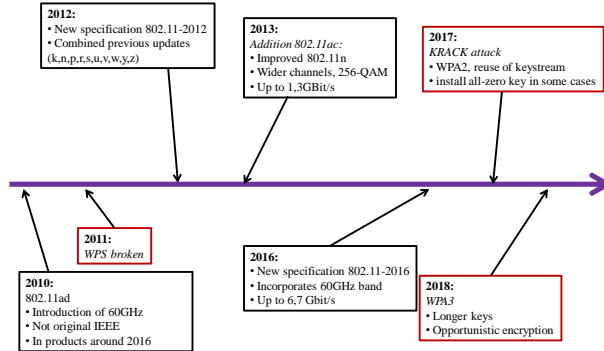

- ▶ IEEE 802.11
- ▶ Security Requirements
 1. Integrity
 2. Confidentiality
 3. Authentication
- ▶ Non-cryptographic access control
 - Hide SSID – Users will have to know the SSID
 - Restrict access based on MAC address
- ▶ Cryptographic protection
 - WEP – Wired Equivalent Privacy
 - WPA – WiFi Protected Access
 - WPA2 – WiFi Protected Access 2
 - WPA3 introduced 2018
- ▶ Specifications are (still) not publically analyzed before they are released!

Both are more or less worthless!

802.11 timeline

802.11 timeline

EITA25 - Computer Security

25

WEP encryption

- ▶ Integrity Check Value (ICV) based on linear cyclic redundancy check
- ▶ Encryption uses stream cipher RC4
- ▶ Size of IV is 24 bits
- ▶ Size of key is 40 or 104 bits
- ▶ **Source of confusion:** 64-bit WEP uses 40-bit keys and 128-bit WEP uses 104 bit keys

EITA25 - Computer Security

26

Weakness of CRC-32

- ▶ Message is divided by a degree 32 polynomial with coefficients in GF(2)
- ▶ Remainder is ICV
- ▶ Linear function – protects only against accidental changes if encryption is "xor plaintext with keystream"
- ▶ Assume we want to add (xor) Δ to plaintext.
 - Compute $\delta = \text{CRC-32}(\Delta)$
 - Add $(\Delta \parallel \delta)$ to ciphertext

$$(M \parallel \text{CRC-32}(M)) \oplus \text{RC4}(K) \oplus (\Delta \parallel \delta) = (M \oplus \Delta \parallel \text{CRC-32}(M) \oplus \delta) \oplus \text{RC4}(K) \\ = (M \oplus \Delta \parallel \text{CRC-32}(M \oplus \Delta)) \oplus \text{RC4}(K)$$

- ▶ We still have a valid message \rightarrow no integrity protection

EITA25 - Computer Security

27

Weakness in encryption

- ▶ IV is only 24 bits
- ▶ After 2^{24} frames the IV will repeat. If the key is not changed the keystream will repeat.

$$C \oplus C' = \text{RC4}(\text{IV} \parallel K) \oplus P \oplus \text{RC4}(\text{IV} \parallel K) \oplus P' = P \oplus P'$$

- ▶ **Much worse problem:** RC4 does not define how to use IV so it was decided to concatenate the IV with key!
- ▶ It is possible to recover the key very fast using this setup
- ▶ It does not matter if it is 40 or 108 bit key, it is still easy to break.
- ▶ No defense against replay attacks
 - Makes it easy to gather lots of encrypted data

EITA25 - Computer Security

28

RC4

- Probably the most well known (and simplest) stream cipher
- Designed 1987 but kept secret, leaked out 1994
- Also referred to as ARC4 and ARCFOUR since the name RC4 is a trademark
- Many weaknesses have been found.
- In SSL/TLS there is no IV in RC4. One stream is used for each key.
 - But there are other problems that makes it unsuitable

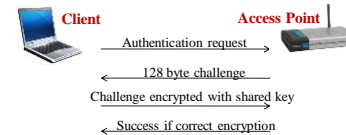

<p>KSA($K[0 \dots \ell - 1]$)</p> <p>Initialization:</p> <p>For $i = 0 \dots N - 1$</p> <p>$S[i] = i$</p> <p>$j = 0$</p> <p>Scrambling:</p> <p>For $i = 0 \dots N - 1$</p> <p>$j = j + S[i] + K[i \bmod \ell]$</p> <p>Swap($S[i], S[j]$)</p>	<p>PRGA(K)</p> <p>Initialization:</p> <p>$i = 0$</p> <p>$j = 0$</p> <p>$S = KSA(K)$</p> <p>Generation loop:</p> <p>$i = i + 1$</p> <p>$j = j + S[i]$</p> <p>Swap($S[i], S[j]$)</p> <p>Output $z = S[S[i] + S[j]]$</p>
---	---

EITA25 - Computer Security

29

Authentication in WEP

- Open system authentication
 - Same as no authentication
 - Client sends identity to authenticator
 - Authenticator sends association message back
- Shared key authentication
 - Prove that you have the key (password)
 - Challenge response protocol using shared WEP key

Attack: Save *keystream* = *challenge* @ *response* for an IV. Use same keystream for any new challenge and use same IV.

EITA25 - Computer Security

30

WPA and WPA2

- Wi-Fi protected Access
- First version (WPA) started to appear in APs around 2003
 - Designed to quickly fix the problems in WEP
 - Important that the same hardware could be used – only a software update was necessary
 - Based on 802.11i, but only a draft of it
 - Much stronger than WEP
 - Better authentication
 - Avoiding confidentiality and integrity problems in WEP
- Full implementation of 802.11i, using AES is called WPA2

EITA25 - Computer Security

31

802.11i Authentication

- Can use a specific server for EAP authentication
 - Supports several methods for authentication
 - More on this in the course "Advanced Computer Security"
 - Authentication server constructs a **Master Session Key (MSK)**
- Can also use a pre-shared key (called WPA-PSK)
 - Still keys are different for each user and each handshake
 - The **pre-shared key (PSK)** is derived from the password
 - Function used is Password-Based Key Derivation Function 2 (PBKDF2)
 - Slow function → Key strengthening

$PSK = PBKDF2(PRF, password, salt, iterations, output\ size)$

- WPA uses PBKDF2(HMAC-SHA1, password, ssid, 4096, 256)

EITA25 - Computer Security

32

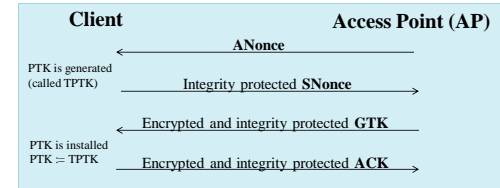

Keys in 802.11i

- ▶ A hierarchy of keys

AP also has a Group Master Key (GMK) used for broadcast messages

4-way handshake

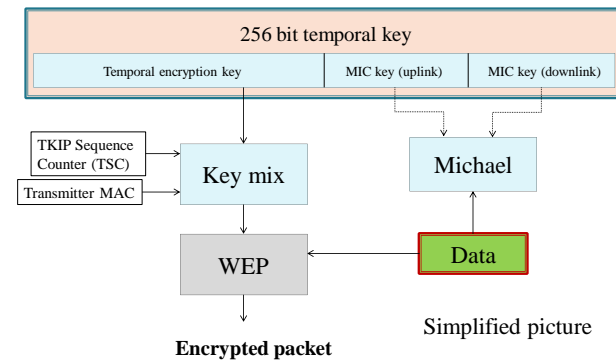

- ▶ PTK is hash of (PMK, MAC_{client} , MAC_{AP} , ANonce, SNonce)
 - Iterated SHA-1
 - Note that MAC here is *MAC address*
- ▶ Last two messages constructed such that *key confirmation* is provided
- ▶ Encryption and integrity protection in handshake uses KCK and KEK
- ▶ GTK is derived from GMK and updates every time someone leaves or enters the network

TKIP

- ▶ Temporal Key Integrity Protocol
- ▶ 256 bit temporal key divided into 128 bit encryption key and 2×64 bit integrity key (one for each direction)
- ▶ Message Integrity Code (MIC), Michael, is used
 - "MIC" removes "MAC" confusion in this context
- ▶ IV is increased to 48 bits and used as counter to prevent replay attacks
- ▶ New encryption key for every frame
 - Encryption key is mixed with counter
- ▶ WEP is still used
- ▶ Attacks on WEP are no longer possible

TKIP (WPA)

CCMP (WPA2)

- ▶ Fully implementing 802.11i
- ▶ RC4 is replaced by AES in CCMP mode
 - AES used in counter mode
 - CBC-MAC based on AES instead of MIC
- ▶ Same 128-bit temporal key used for both encryption and MAC
 - Authenticated encryption
- ▶ Require new hardware since completely new encryption algorithm is used

KRACK Attack

- ▶ October 2017
- ▶ Third step in 4-way handshake will install key in devices
- ▶ Force authenticator to replay message 3 → supplicant reinstalls same key
 - Nonce is reset
 - Replay counter is reset
- ▶ Android 6.0: Zero key is installed

Details are very implementation dependent

What's next?

- ▶ Optional Exam 22/3, 14-19, MA8
 - For grade 4-5
- ▶ If you want more security courses
 - Web security HT1, 4hp,
 - Advanced computer security, HT1, 7.5hp
 - Advanced web security, HT2, 7.5hp
 - Cryptology, HT2, 7.5hp
 - Secure Systems Engineering, VT1, 7.5hp (start 2020)
