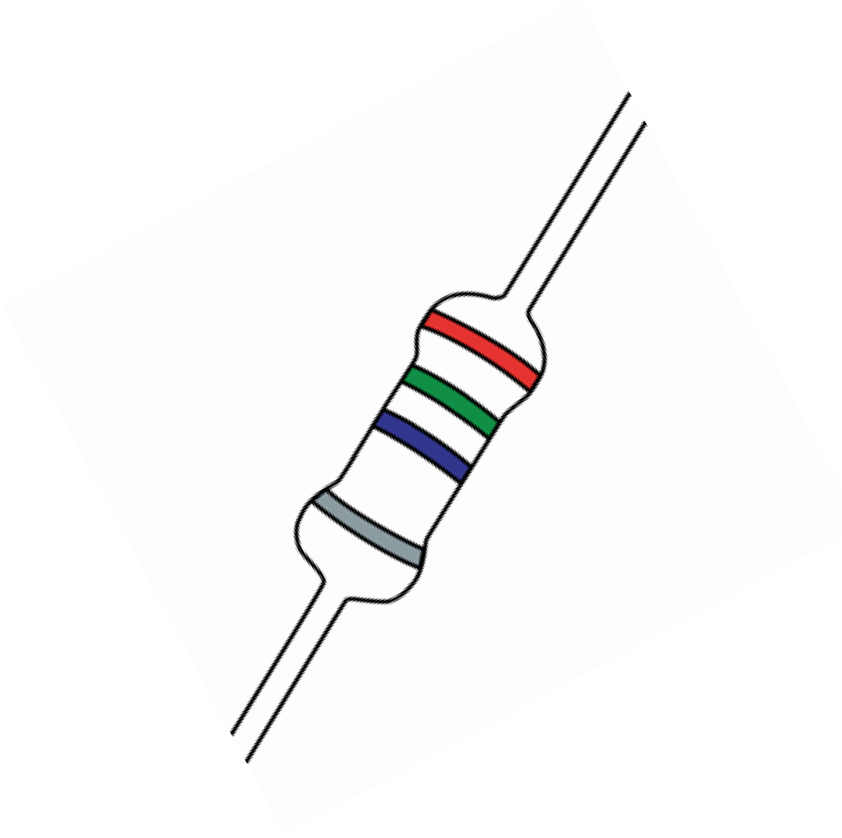
Föreläsning 6

Tidsberoende Signaler – växelström (AC)

Komplexa Tal



Senaste föreläsning

- Resistanser

$$v(t) = i(t)R$$

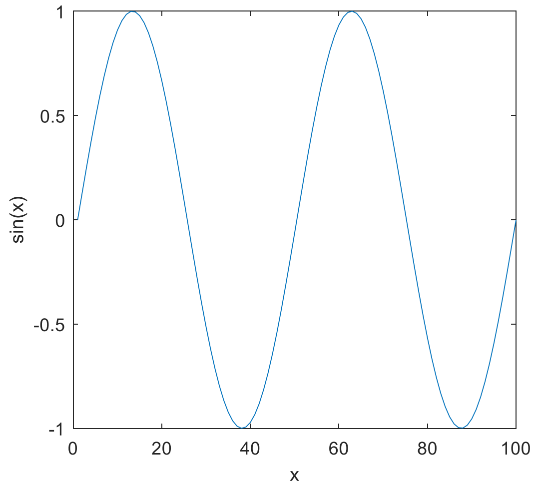
- Kondensatorer – Kapacitans 
$$i(t) = C\frac{dv(t)}{dt}$$

$$v(t) = \frac{1}{C}\int i(t')dt'$$

- Spolar – Induktans 
$$v(t) = L\frac{di(t)}{dt}$$

$$i(t) = \frac{1}{L}\int v(t')dt'$$

Tidsberoende Signaler – sin(ωt)



$$v(t) = V_0 \sin(\underbrace{2\pi f}_{\omega} t + \phi)$$

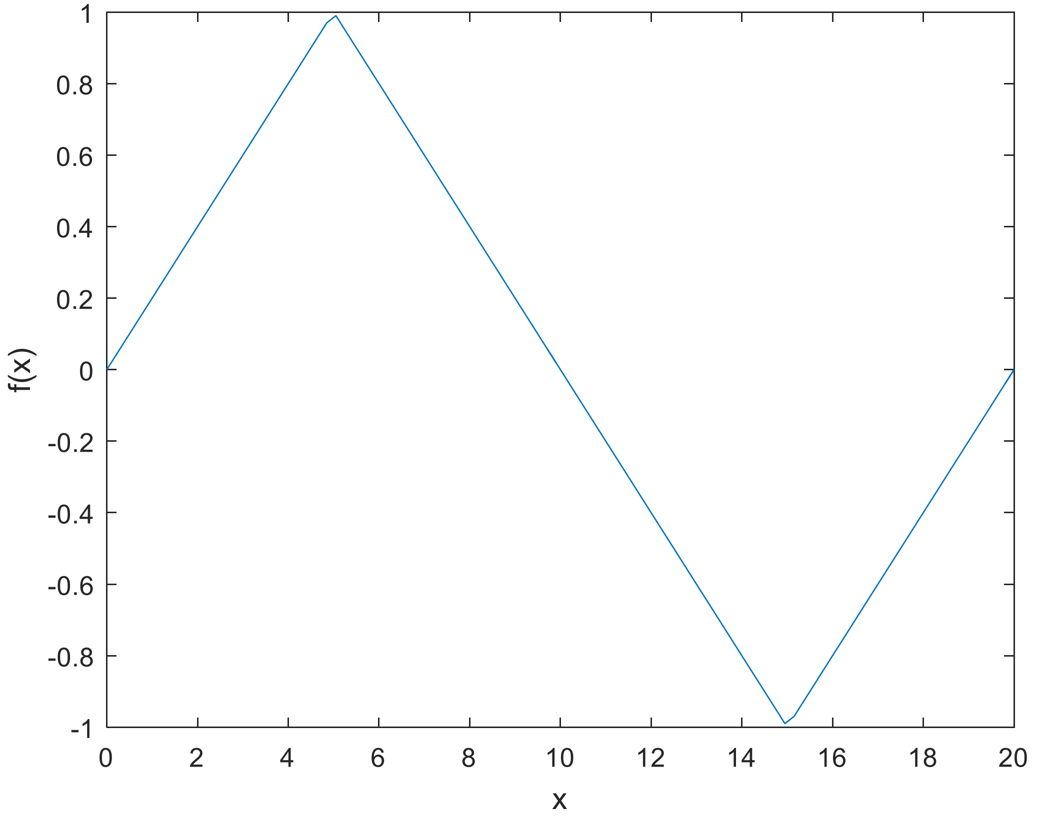
vinkelfrekvens

Växelström/spänning - eluttag
f=50 Hz
V_0=325V (toppvärde)

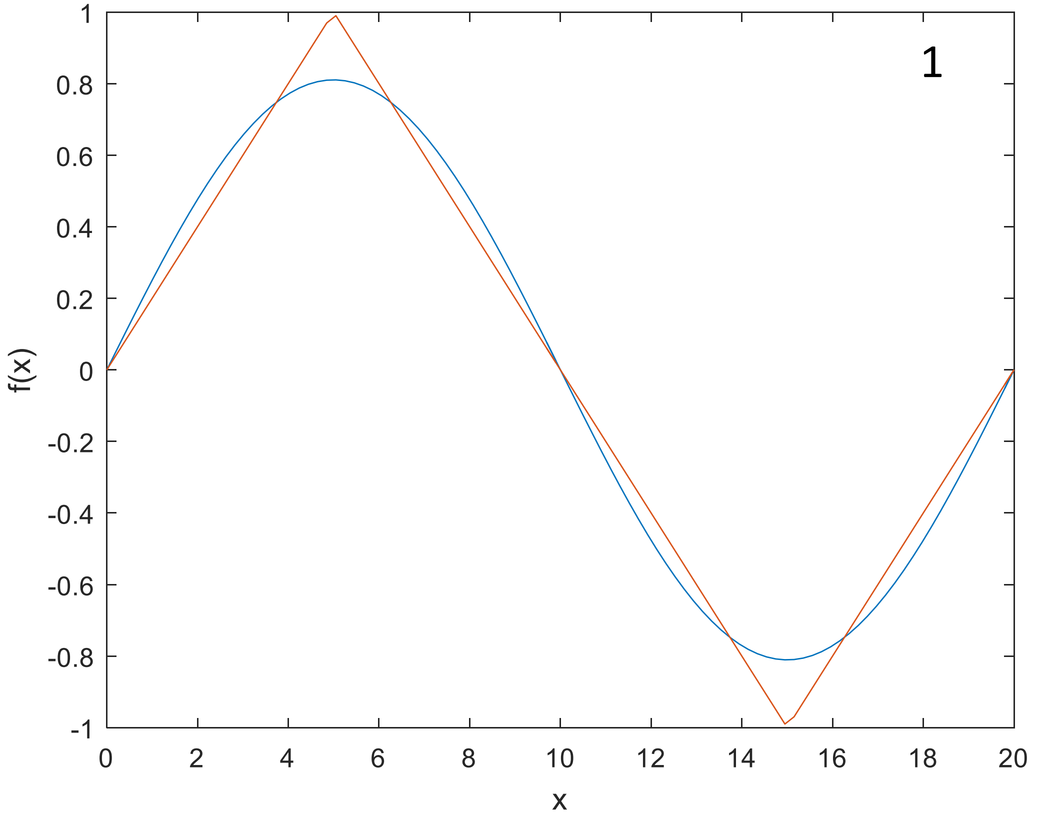
Fourieranalys – alla fysiskt realiserbara signaler kan skrivas som en summa av sinus och cosinus-termer (!!!)

$$v(t) = \sum_{n=0} A_n \sin(n \cdot \omega_0 t) + B_n \cos(n \cdot \omega_0 t)$$

V(t) - triangelvåg

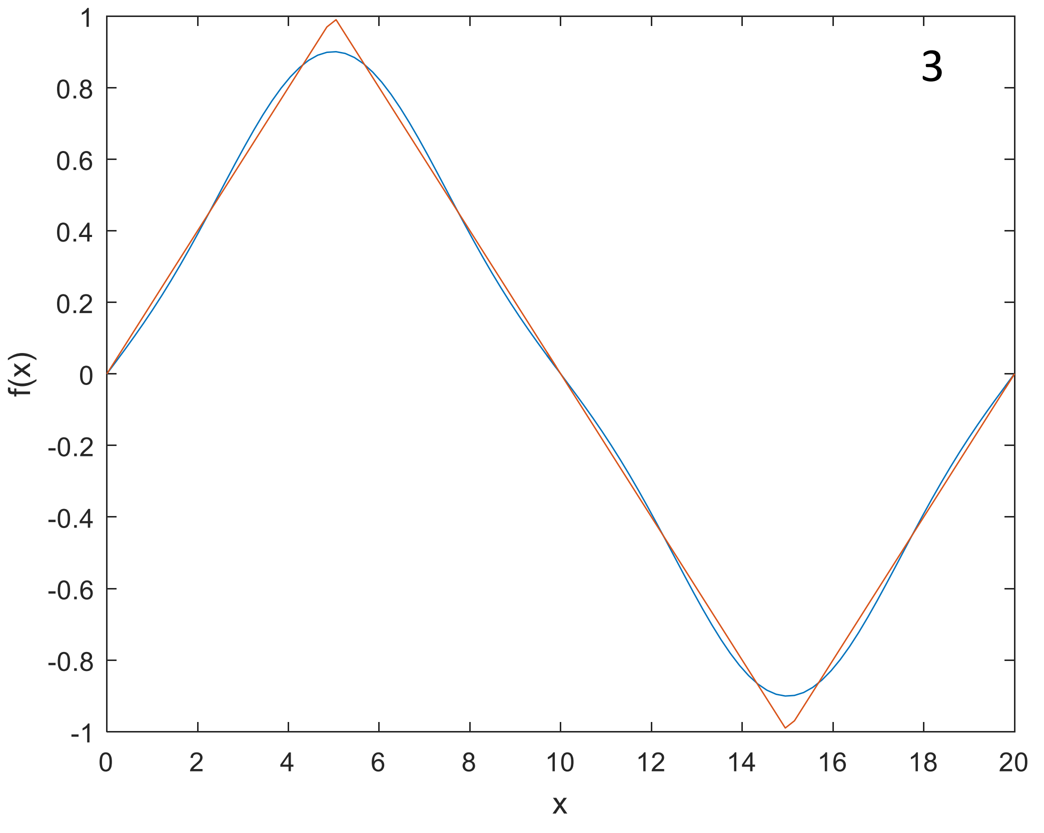


V(t) - triangelvåg



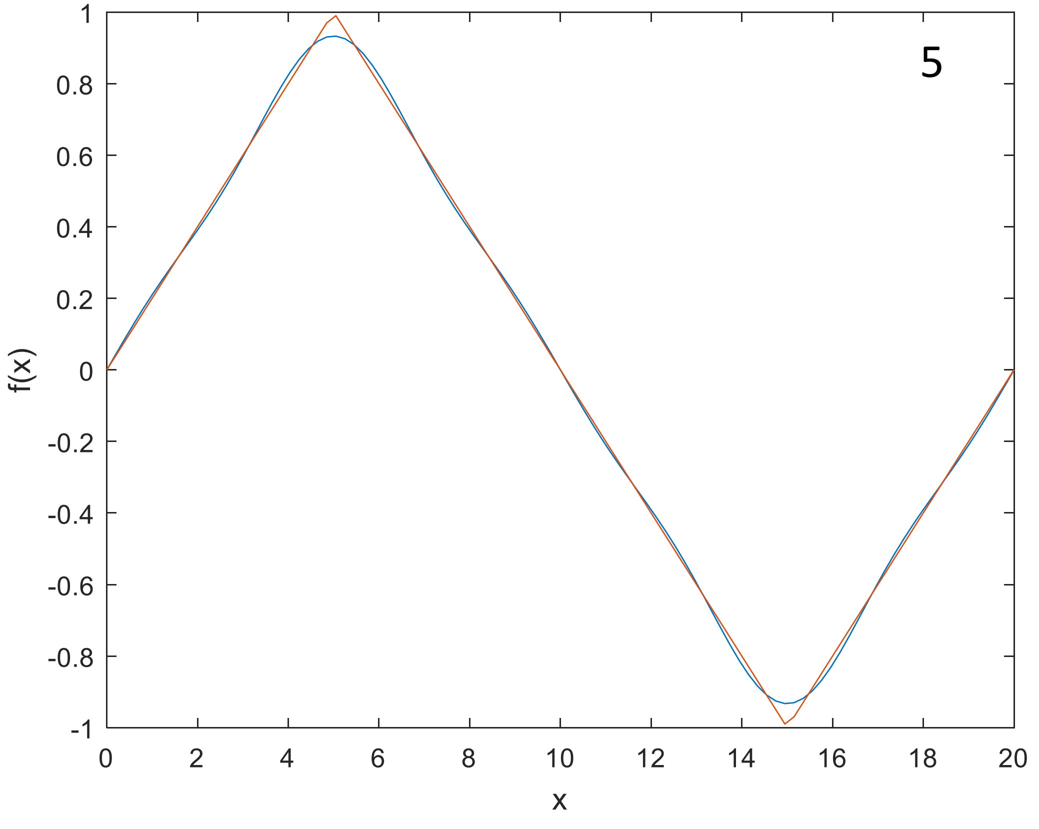
$$f(x) \approx \frac{8}{\pi^2} \sin\left(\frac{\pi x}{20}\right)$$

V(t) - triangelvåg



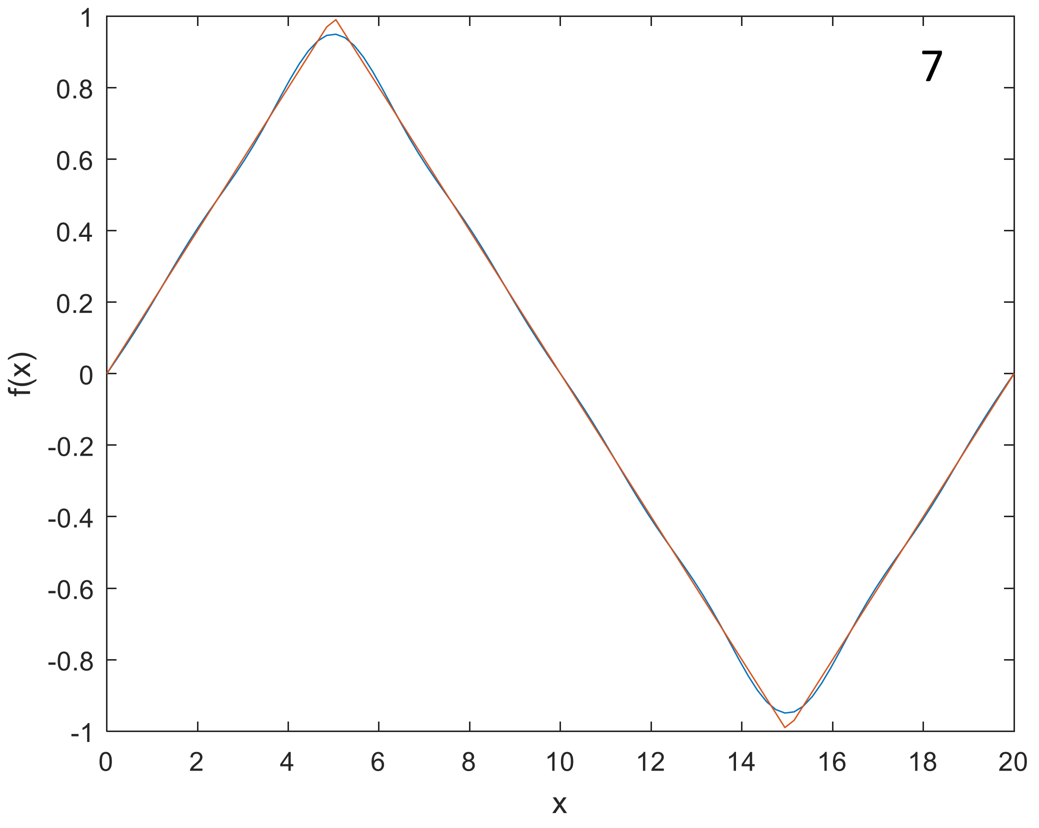
$$f(x) \approx \frac{8}{\pi^2}\sin\left(\frac{\pi}{20}x\right) - \frac{1}{9}\frac{8}{\pi^2}\sin\left(3\frac{\pi}{20}x\right)$$

V(t) - triangelvåg



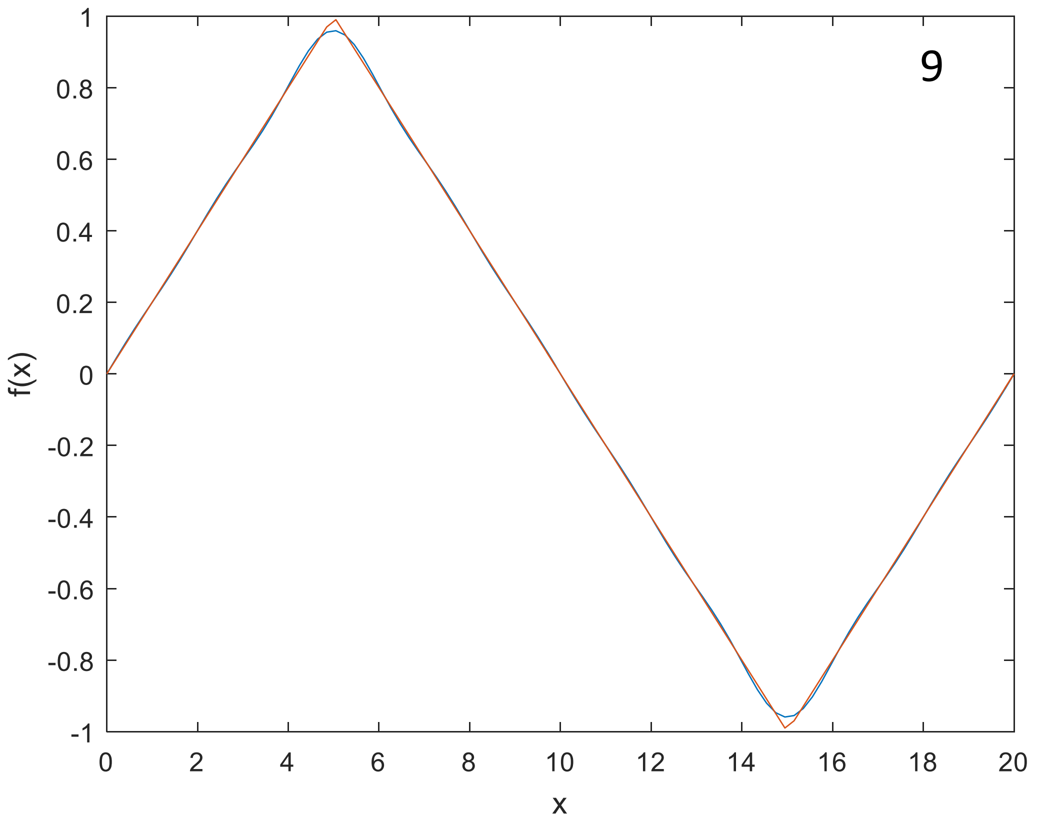
$$f(x) \approx \frac{8}{\pi^2}\sin\left(\frac{\pi}{20}x\right) - \frac{1}{9}\frac{8}{\pi^2}\sin\left(3\frac{\pi}{20}x\right) + \frac{1}{25}\frac{8}{\pi^2}\sin\left(5\frac{\pi}{20}x\right)$$

V(t) - triangelvåg



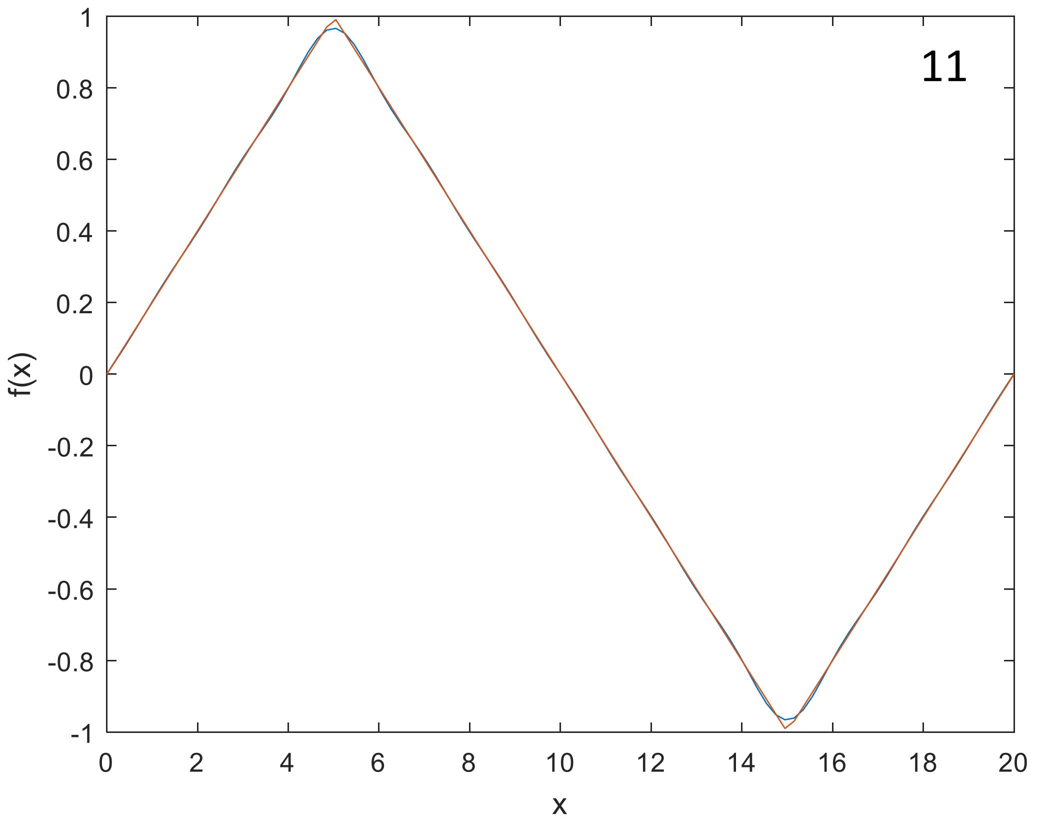
$$f(x) \approx \frac{8}{\pi^2}\sin\left(\frac{\pi}{20}x\right) - \frac{1}{9}\frac{8}{\pi^2}\sin\left(3\frac{\pi}{20}x\right) + \frac{1}{25}\frac{8}{\pi^2}\sin\left(5\frac{\pi}{20}x\right) - \frac{1}{49}\frac{8}{\pi^2}\sin\left(7\frac{\pi}{20}x\right)$$

V(t) - triangelvåg

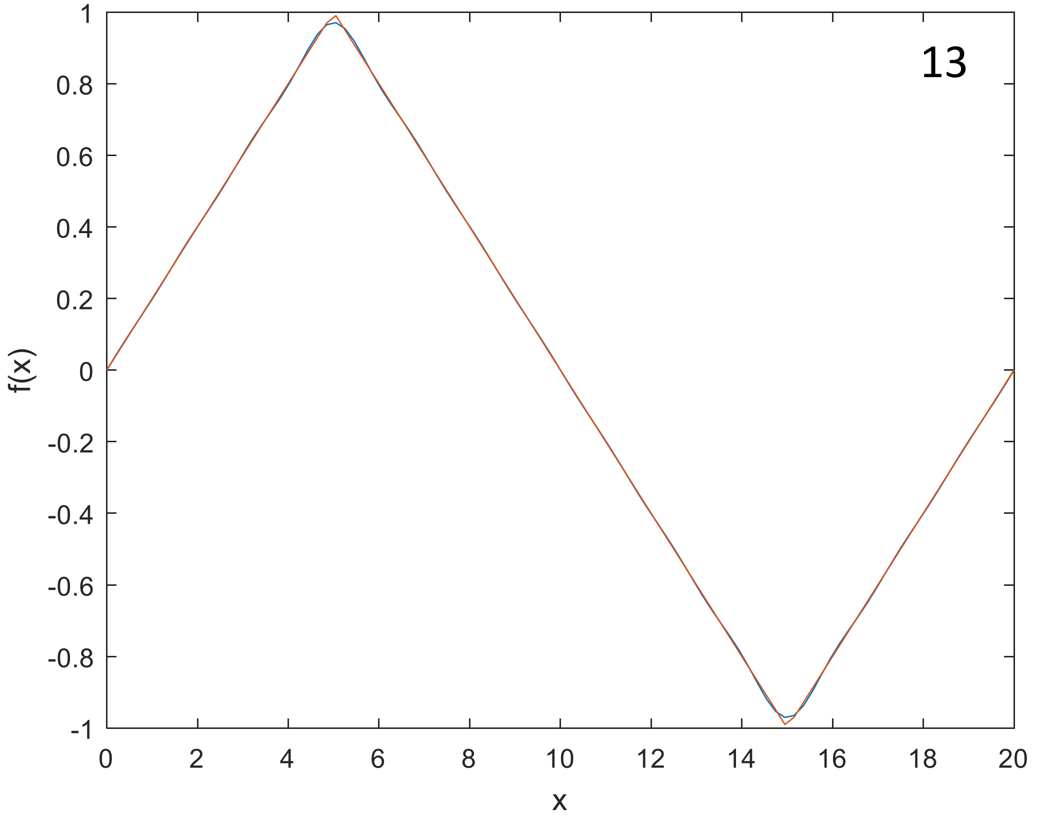


$$f(x) \approx \frac{8}{\pi^2}\sin\left(\frac{\pi}{20}x\right) - \frac{1}{9}\frac{8}{\pi^2}\sin\left(3\frac{\pi}{20}x\right) + \frac{1}{25}\frac{8}{\pi^2}\sin\left(5\frac{\pi}{20}x\right) - \frac{1}{49}\frac{8}{\pi^2}\sin\left(7\frac{\pi}{20}x\right) + \cdots$$

V(t) - triangelvåg



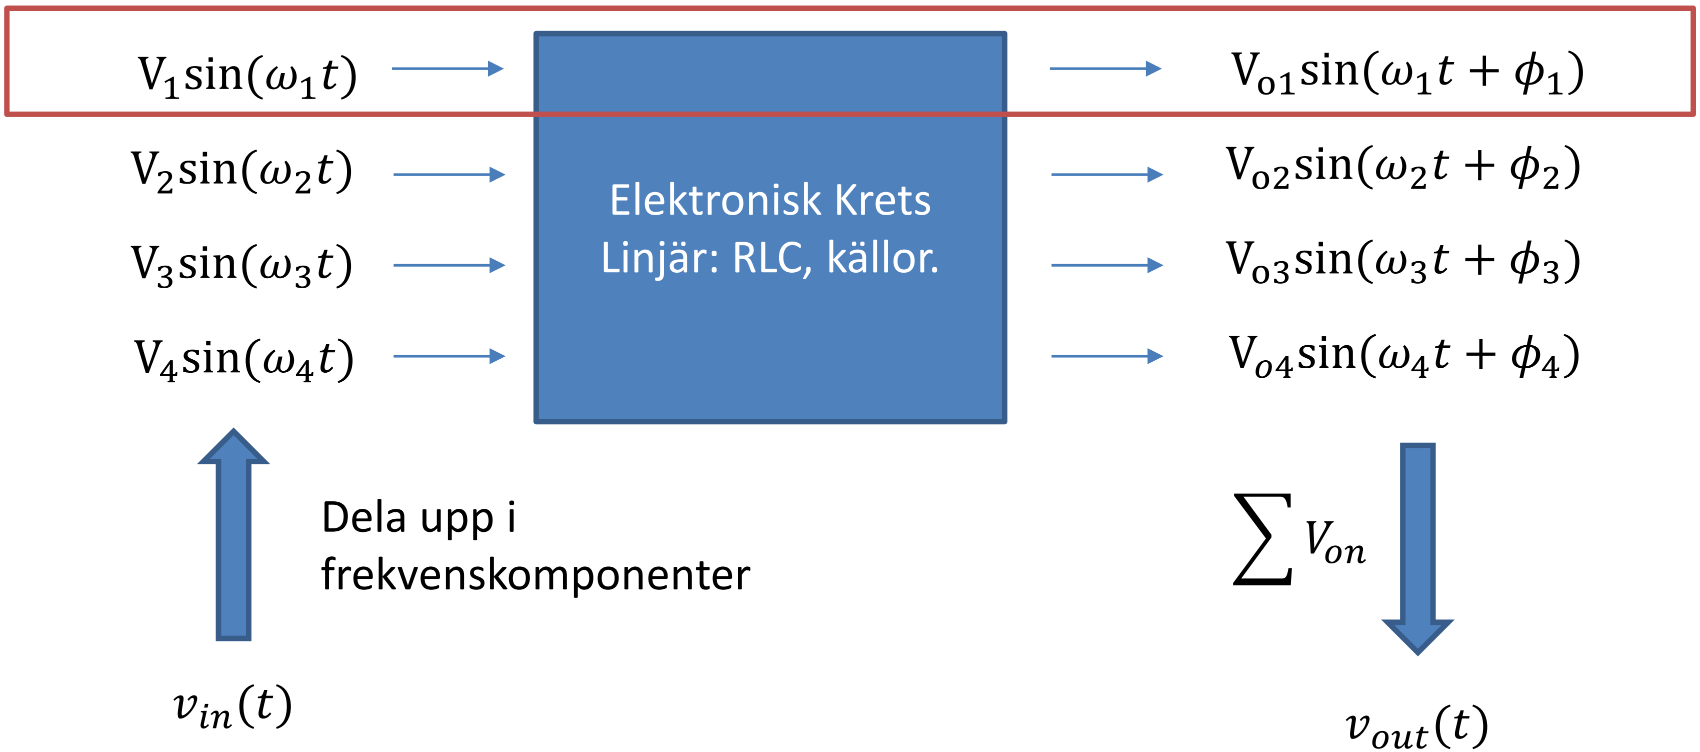
V(t) - triangelvåg



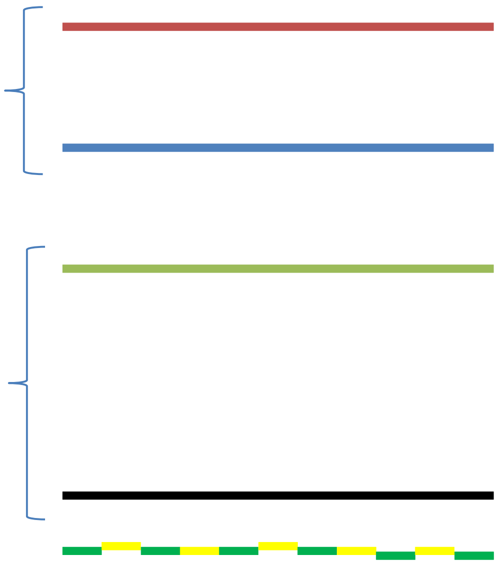
Alla signaler kan uttryckas som en ***summa*** av (co)sinustermer!
Superposition – vi kan hantera termerna var för sig!

Tidsberoende signaler - superposition

Linjär krets: Amplitud och fas ändras
Frekvensen (ω) är konstant!



3-fas



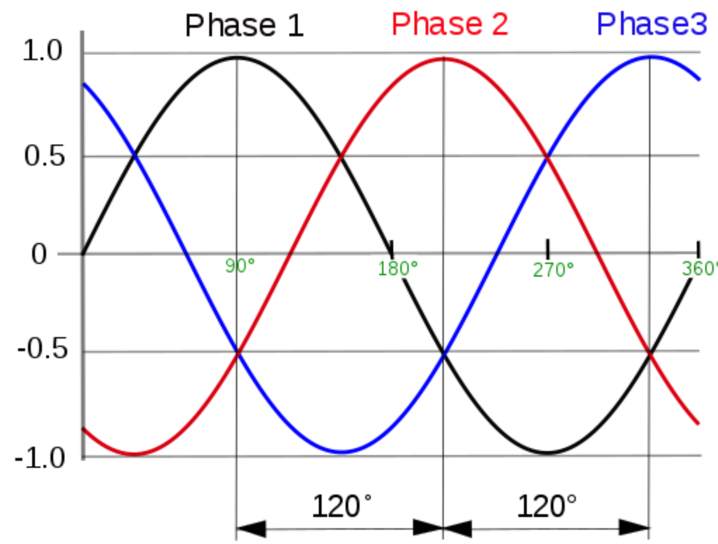
$325\cos(\omega t - 120°)$

$325\cos(\omega t + 120°)$

$325\cos(\omega t)$

Nolla (jord)

Skyddsjord (jord)



Jämnare effektöverföring

$$\frac{325}{\sqrt{2}} = 230V$$

Spänning (Effektivvärde) mellan de olika faserna och nolla. *Vanliga eluttag.*

$$\frac{563}{\sqrt{2}} = 400V$$

Spänning (Effektivvärde) mellan två faser. Tillämpningar som kräver högre effekt. *Spisar. Elmaskiner.*

Frekvensområden

$V_1 \sin(\omega_1 t)$

$V_2 \sin(\omega_2 t)$

$V_3 \sin(\omega_3 t)$

$V_4 \sin(\omega_4 t)$

...

Audio: 20 Hz – 20 kHz

$$20 < \frac{\omega}{2\pi} < 20\ kHz$$

$V_1 \sin(\omega_1 t)$

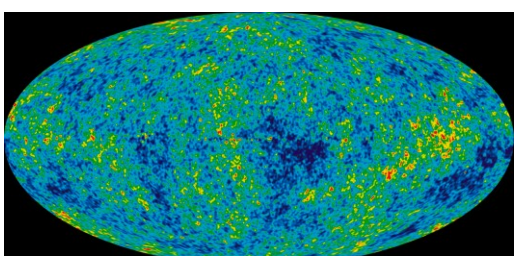
$V_2 \sin(\omega_2 t)$

$V_3 \sin(\omega_3 t)$

$V_4 \sin(\omega_4 t)$

...

Kommunikation:
900 MHz – 60 GHz



$V_1 \sin(\omega_1 t)$

$V_2 \sin(\omega_2 t)$

$V_3 \sin(\omega_3 t)$

$V_4 \sin(\omega_4 t)$

...

Mikrovågsbakgrund från Big Bang:
70-800 GHz

Komplexa Tal

Häfte på hemsidan – delas även ut på övningarna.

Repetition

Komplex spänning <–> tidsharmonisk spänning

Mer detaljer och matematisk stringens : Analysen i HT2

Komplexa Tal

$$z = a + jb$$

$$z = |z|(\cos(\phi) + \mathrm{j} \cdot \sin(\phi))$$

$$|z| = \sqrt{}(a^2 + b^2)$$

$$\phi = \arctan\left(\frac{b}{a}\right)$$

$$z = |z|e^{j\phi}$$

$$e^a e^b = e^{a+b}$$

$$Re(z) = |z|\cos(\phi)$$

$$\frac{e^a}{e^b} = e^{a-b}$$

$$Im(z) = |z|sin(\phi)$$

$$v(t) = V_0 \cos(\omega t + \theta) = Re\left(V_0 e^{j\theta} e^{j\omega t}\right)$$

Komplexa Tal

Addition är enkelt i rektangulär form:

$$z_1 + z_2 = (a_1 + a_2) + j(b_1 + b_2)$$

Multiplikation är enkelt i polär form:

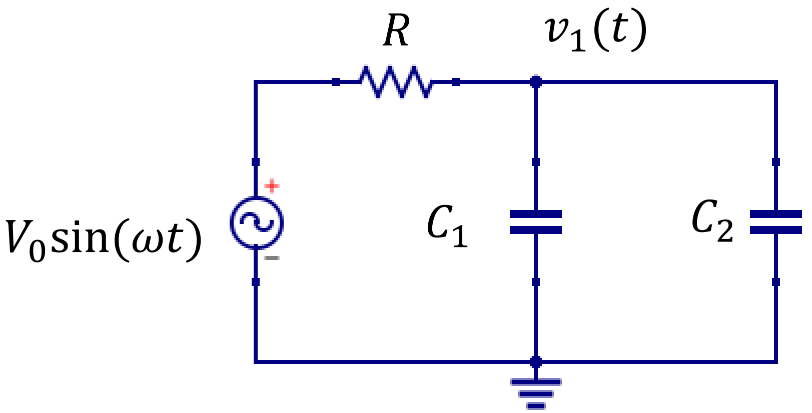
$$z_1 z_2 = |z_1||z_2|e^{j(\theta_1 + \theta_2)}$$

Tidsharmoniska Signaler -

$$v(t) = V_0 \cos(\omega t + \theta) = Re\left(V_0 e^{j\theta} e^{j\omega t}\right)$$

$V_0 e^{j\theta}$ Alla beräkningar kan göras med addition/multiplikation av komplexa tal!

Tidsberoende Signaler

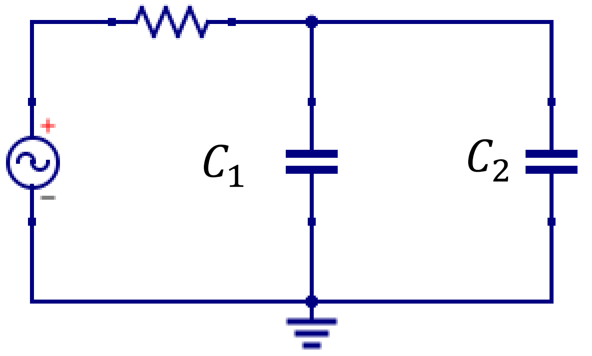


$$\frac{v_1(t) - V_0\sin(\omega t)}{R} + C_1\frac{dv_1(t)}{dt} + C_2\frac{dv_1(t)}{dt} = 0$$

Differentialekvationslösning. Relativt komplicerat.

Detta behöver göras om källan inte är rent tidsharmonisk.

Tidsberoende Signaler



Linjära system

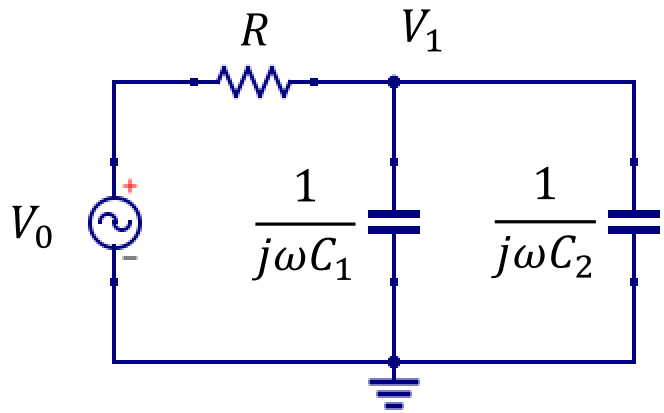
$\mathrm{V}_0 \sin(\omega t) \longrightarrow \mathrm{V}_1 \sin(\omega t + \phi_1)$

$$\frac{V_1 sin(\omega t + \phi_1) \; - V_0 \sin(\omega t)}{R} + C_1 \frac{dv_1(t)}{dt} + C_2 \frac{dv_1(t)}{dt} = 0$$

$$\frac{V_1 sin(\omega t + \phi_1) - V_0 \sin(\omega t)}{R} + C_1 V_1 \omega \cos(\omega t + \phi_1) + C_2 V_1 \omega \cos(\omega t + \phi_1) = 0$$

+ en massa trigonimetriska identiter… → lösningen, men fortfarande komplicerat

Tidsberoende Signaler – komplexa tal



V_1 – komplext tal. Både storlek $|V_1|$ och fas (ϕ)

$$\frac{V_1 - V_0}{R} + j\omega(C_1 + C_2)V_1 = 0$$

$$V_1 = \frac{V_0}{1 + j\omega R(C_1 + C_2)} = |V_1|e^{\arg(V_1)j}$$

$$C = C_1 + C_2$$

$v(t) = Re(V_1 e^{j\omega t}) =$
$= |V_1|\cos(\omega t + \arg(V_1)) \rightarrow$

$$v(t) = \frac{V_0}{\sqrt{1 + \omega^2 R^2 C^2}} \cos(\omega t - \arctan(\omega RC))$$

Komplexa Tal - Sammanfattning

COMPLEX QUANTITIES AND THEIR USE IN ELECTRICAL ENGINEERING.

BY CHAS. PROTEUS STEINMETZ.

I.—INTRODUCTION.

In the following, I shall outline a method of calculating alternate current phenomena, which, I believe, differs from former methods essentially in so far, as it allows us to represent the alternate current, the sine-function of time, by a *constant* numerical quantity, and thereby eliminates the independent variable "time" altogether from the calculation of alternate current phenomena.

Herefrom results a considerable simplification of methods. Where before we had to deal with periodic functions of an independent variable, time, we have now to add, subtract, etc.,

Charles Proteus Steinmetz
