

Network layer

- ❖ transport segment from sending to receiving host
- ❖ on sending side encapsulates segments into datagrams
- ❖ on rcving side, delivers segments to transport layer
- ❖ network layer in every host, router
- ❖ router examines header in all IP datagrams passing through it

Network Layer 4-2

Two Key Network-Layer Functions

- ❖ **forwarding**: move packets from router's input to appropriate router output
 - ❖ **routing**: determine route taken by packets from source to dest.
 - routing algorithms
- analogy:**
- ❖ **routing**: process of planning trip from source to dest
 - ❖ **forwarding**: process of getting through single interchange

Network Layer 4-3

Interplay between routing and forwarding

Network Layer 4-4

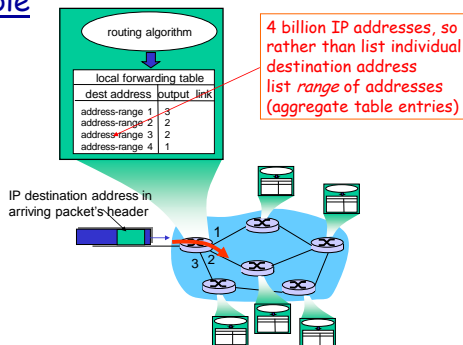

Datagram networks

- ❖ no call setup at network layer
- ❖ routers: no state about end-to-end connections
 - no network-level concept of "connection"
- ❖ packets forwarded using destination host address
 - packets between same source-dest pair may take different paths

Network Layer 4-5

Datagram Forwarding table

Network Layer 4-6

Longest prefix matching

Longest prefix matching — when looking for forwarding table entry for given destination address, use *longest* address prefix that matches destination address.

Destination Address Range	Link interface
11001000 00010111 00010*** *****	0
11001000 00010111 00011000 *****	1
11001000 00010111 00011*** *****	2
otherwise	3

Examples:

DA: 11001000 00010111 0001**0110** 10100001 Which interface?
 DA: 11001000 00010111 0001**1000** 10101010 Which interface?

Network Layer 4-8

Chapter 4: Network Layer

- 4.1 Introduction
- 4.2 Virtual circuit and datagram networks
- 4.3 What's inside a router?
- 4.4 IP: Internet Protocol
 - Datagram format
 - IPv4 addressing
 - ICMP
 - IPv6
- 4.5 Routing algorithms
 - Link state
 - Distance Vector
 - Hierarchical routing
- 4.6 Routing in the Internet
 - RIP
 - OSPF
 - BGP
- 4.7 Broadcast and multicast routing

Network Layer 4-9

Router Architecture Overview

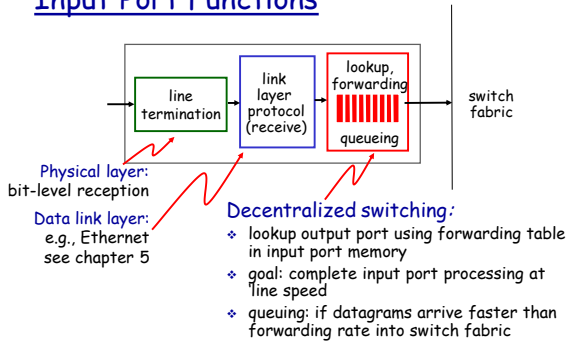

two key router functions:

- ❖ run routing algorithms/protocol (RIP, OSPF, BGP)
- ❖ forwarding datagrams from incoming to outgoing link

Network Layer 4-10

Input Port Functions

Network Layer 4-11

Switching fabrics

- ❖ transfer packet from input buffer to output buffer
- ❖ switching rate: rate at which packets can be transfer from inputs to outputs
 - N inputs: switching rate N times line rate desirable
- ❖ three types of switching fabrics

Network Layer 4-12

Switching Via Memory

First generation routers:

- ❖ traditional computers with switching under direct control of CPU
- ❖ packet copied to system's memory
- ❖ speed limited by memory bandwidth (2 bus crossings per datagram)

Network Layer 4-13

Switching Via a Bus

- ❖ datagram from input port memory to output port memory via a shared bus
- ❖ bus contention: switching speed limited by bus bandwidth

Network Layer 4-14

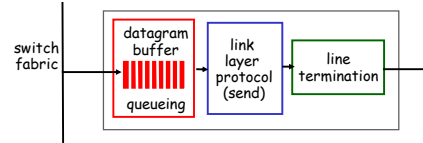

Switching Via An Interconnection Network

- ❖ overcome bus bandwidth limitations
- ❖ advanced design: fragmenting datagram into fixed length cells, switch cells through the fabric.

Network Layer 4-15

Output Ports

- ❖ *buffering* required when datagrams arrive from fabric faster than the transmission rate
- ❖ *scheduling discipline* chooses among queued datagrams for transmission

Network Layer 4-16

Output port queuing

- ❖ buffering when arrival rate exceeds output line speed

Network Layer 4-17

Input Port Queuing

- ❖ fabric slower than input ports combined -> queuing may occur at input queues
 - *queuing delay and loss due to input buffer overflow!*
- ❖ **Head-of-the-Line (HOL) blocking:** queued datagram at front of queue prevents others in queue from moving forward

output port contention:
only one red datagram can be transferred.
lower red packet is blocked

one packet time later:
green packet experiences HOL blocking

Network Layer 4-19
