

## Simulation

The following is needed:

- A description of the state of the system
- The events that can occur
- Rules describing what will happen if an event occurs

## The event list

Keeps track of when events shall happen

T1	T2	T3	T4
E1	E2	E3	E4
A1	A2	A3	A4

$T_i$  = time when event  $E_i$  will take place

$A_i$  = attributes to event  $i$

The list is sorted:  $T_1 < T_2 < T_3 < T_4$  etc.

## How a simulation run is done

1. Extract the first element in the event list
2. Set Time = the time of the extracted event
3. Update the state of the system and insert new events if needed
4. If not finished, Go to 1

## An example: a queuing system

It might be of interest to find

- Probability of rejection
- Mean (or variance) of time spent in system
- The mean number of customers in the system

## The state description

Assume that we want to find the mean number of customers in the queue.

$N$  = number of customers in the system

The appropriate state description depends on the results we desire

## Events that may take place

- Arrival
- Departure (when service is ready)
- Measurement (does not change the state)

## What we also need to know

Assume the following:

- The service time distribution is exponential with mean 2
- The mean time between arrivals is exponential with mean 3
- The number of places in the waiting line is infinite

## Rule at arrival

```
N := N + 1;  
If N=1 then  
    add departure to event list ;  
Add a new arrival to event list;
```

When we add the departure and arrival we have to draw a random number (exponentially distributed)

## Rule at departure

```
N := N - 1;  
If N>0 then  
    add departure to event list ;
```

## Rule at measurement

```
Write(N)  
Add a new measurement to event  
list;
```

## When the simulation begins

<b>Time and state:</b>	<b>Event list:</b>
Time = 0	3 Arrival
N = 0	5 measurement

## Step 1

<b>Time and state:</b>	<b>Event list:</b>
Time = 3	4 Arrival
N = 1	5 measurement
	9 Departure

## Step 2

**Time and state:**  
Time = 4  
N = 2

**Event list:**  
5 measurement  
9 Departure  
10 Arrival

## Step 3

**Time and state:**  
Time = 5  
N = 2

**Event list:**  
9 Departure  
10 Arrival  
14 Measurement

## Step 4

**Time and state:**  
Time = 9  
N = 1

**Event list:**  
10 Arrival  
12 Departure  
14 Measurement

```
begin
  a := 3; (* mean time between arrivals = 3 *)
  s := 2; (* mean service time = 3 *)
  m := 10; (* mean time between measurements = 10 *)
  simulationlength := 1000;
  No_in_queue := 0;
  time := 0;
  insert_event(measurement, Exp(m));
  insert_event(arrival, Exp(a));
  while time < simulationlength do
    begin
      dummy := FirstInQueue(eventlist);
      time := dummy.eventtime;
      case dummy.eventkind of
        arrival: arrive;
        departure: depart;
        measurement: measure;
      end;
    end;
  end;
end.
```

```
procedure arrive;
begin
  if No_in_queue = 0 then
    insert_event(departure, Exp(s));
  No_in_queue := No_in_queue + 1;
  insert_event(arrival, Exp(a));
end;

procedure depart;
begin
  No_in_queue := No_in_queue - 1;
  if No_in_queue > 0 then
    insert_event(departure, Exp(s));
  end;
end;

procedure measure;
begin
  write(utfil, No_in_queue);
  insert_event(measurement, Exp(m));
end;
```
